

Improvement in Operational Seasonal Forecast Using JMA/MRI-CGCM

Akira Ito

**Climate Prediction Division
Global Environment and Marine Department
Japan Meteorological Agency**

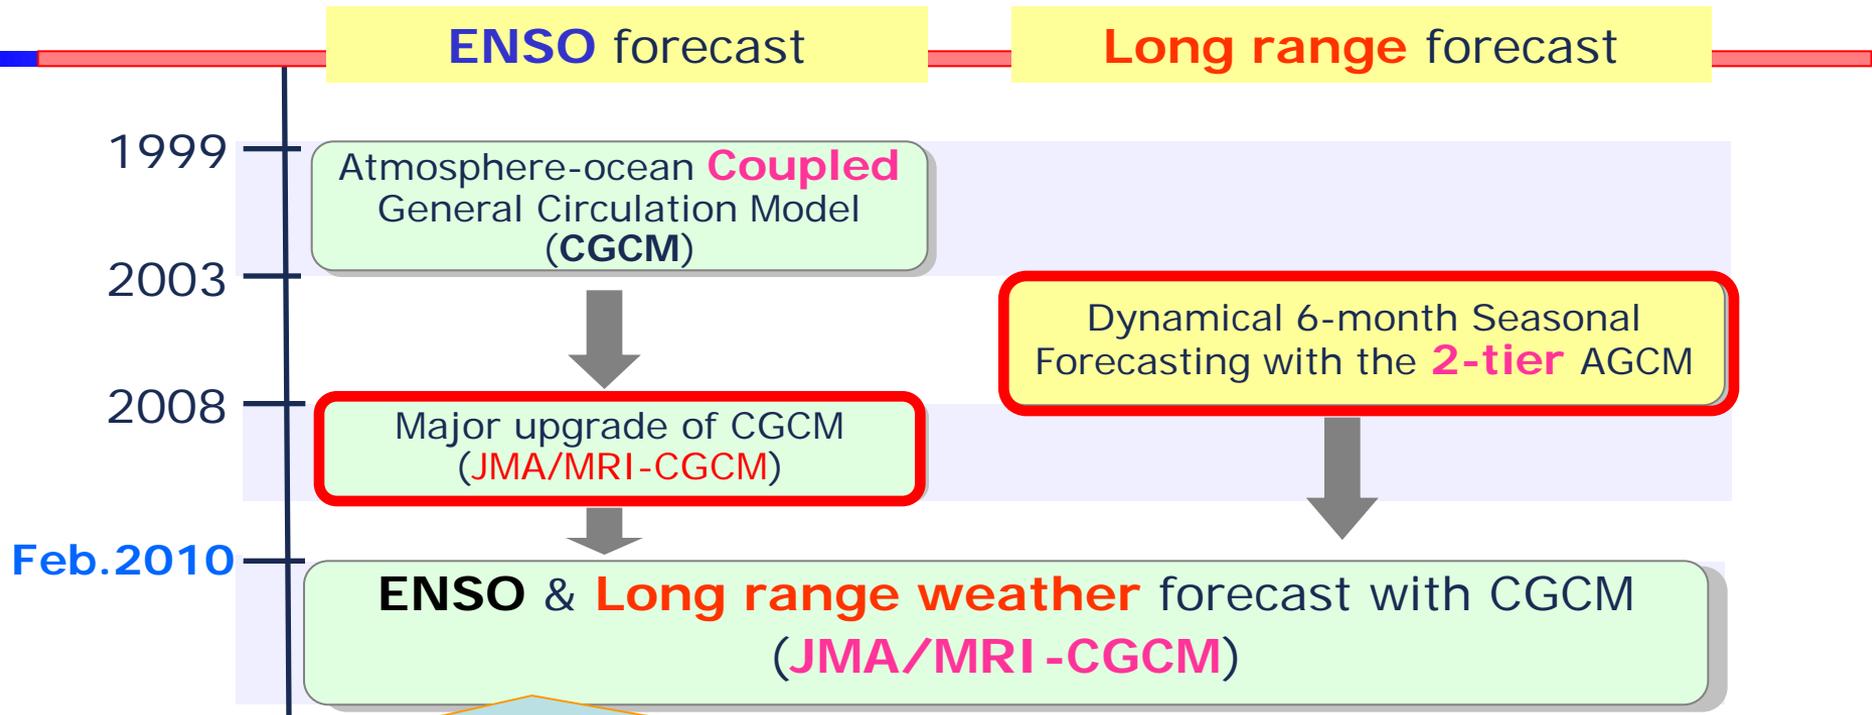

Outline

- 1. Introduction of the New Long Range Forecast System at JMA**
- 2. Performance Comparison of Old and New system**
- 3. Improvement of Numerical Guidance for the climate in Japan**

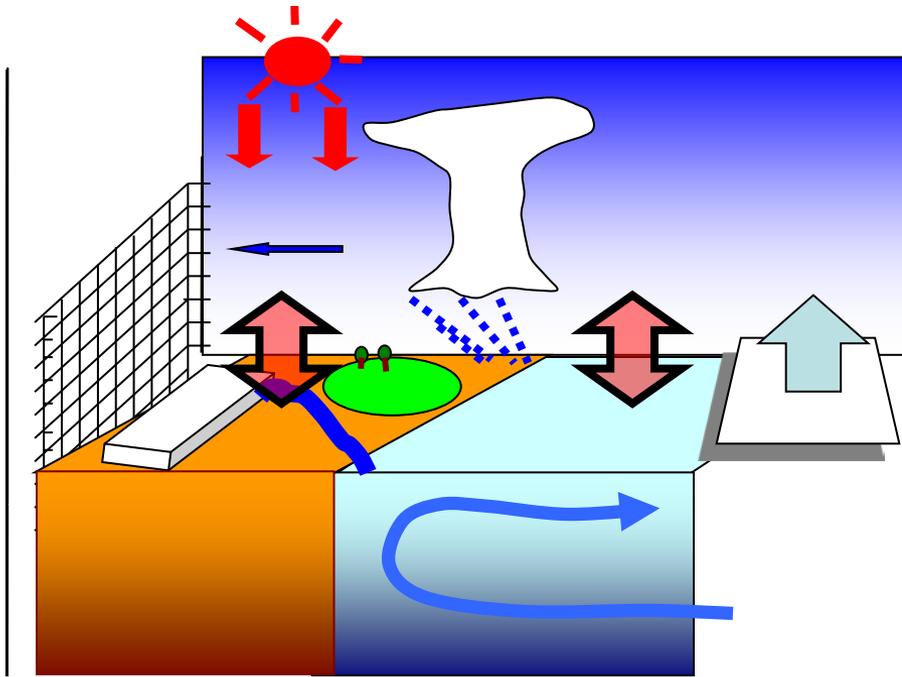

History

In 1999, JMA introduced the atmosphere-ocean coupled GCM into our ENSO forecasting service. In 2003, 2-tier dynamical ensemble prediction system began to be used in the long range weather forecast service. In 2008, an entirely new coupled forecast system developed by JMA and Meteorological Research Institute (MRI) became an operational ENSO forecast system. We finally introduced this coupled system for the long range weather forecasting services in February 2010.

Outline of the EPS for seasonal forecast

CGCM: JMA/MRI-CGCM

AGCM: JMA-GSM based on JMA/MRI unified model

- TL95: 1.875 deg ~ 180km
- L40: model top = 0.4hPa
- Land: SiB
- Sea ice: climatology
- Initial condition: JRA-25/JCDAS
- Initial perturbation: BGM (TRO, NH)

OGCM: MRI.COM

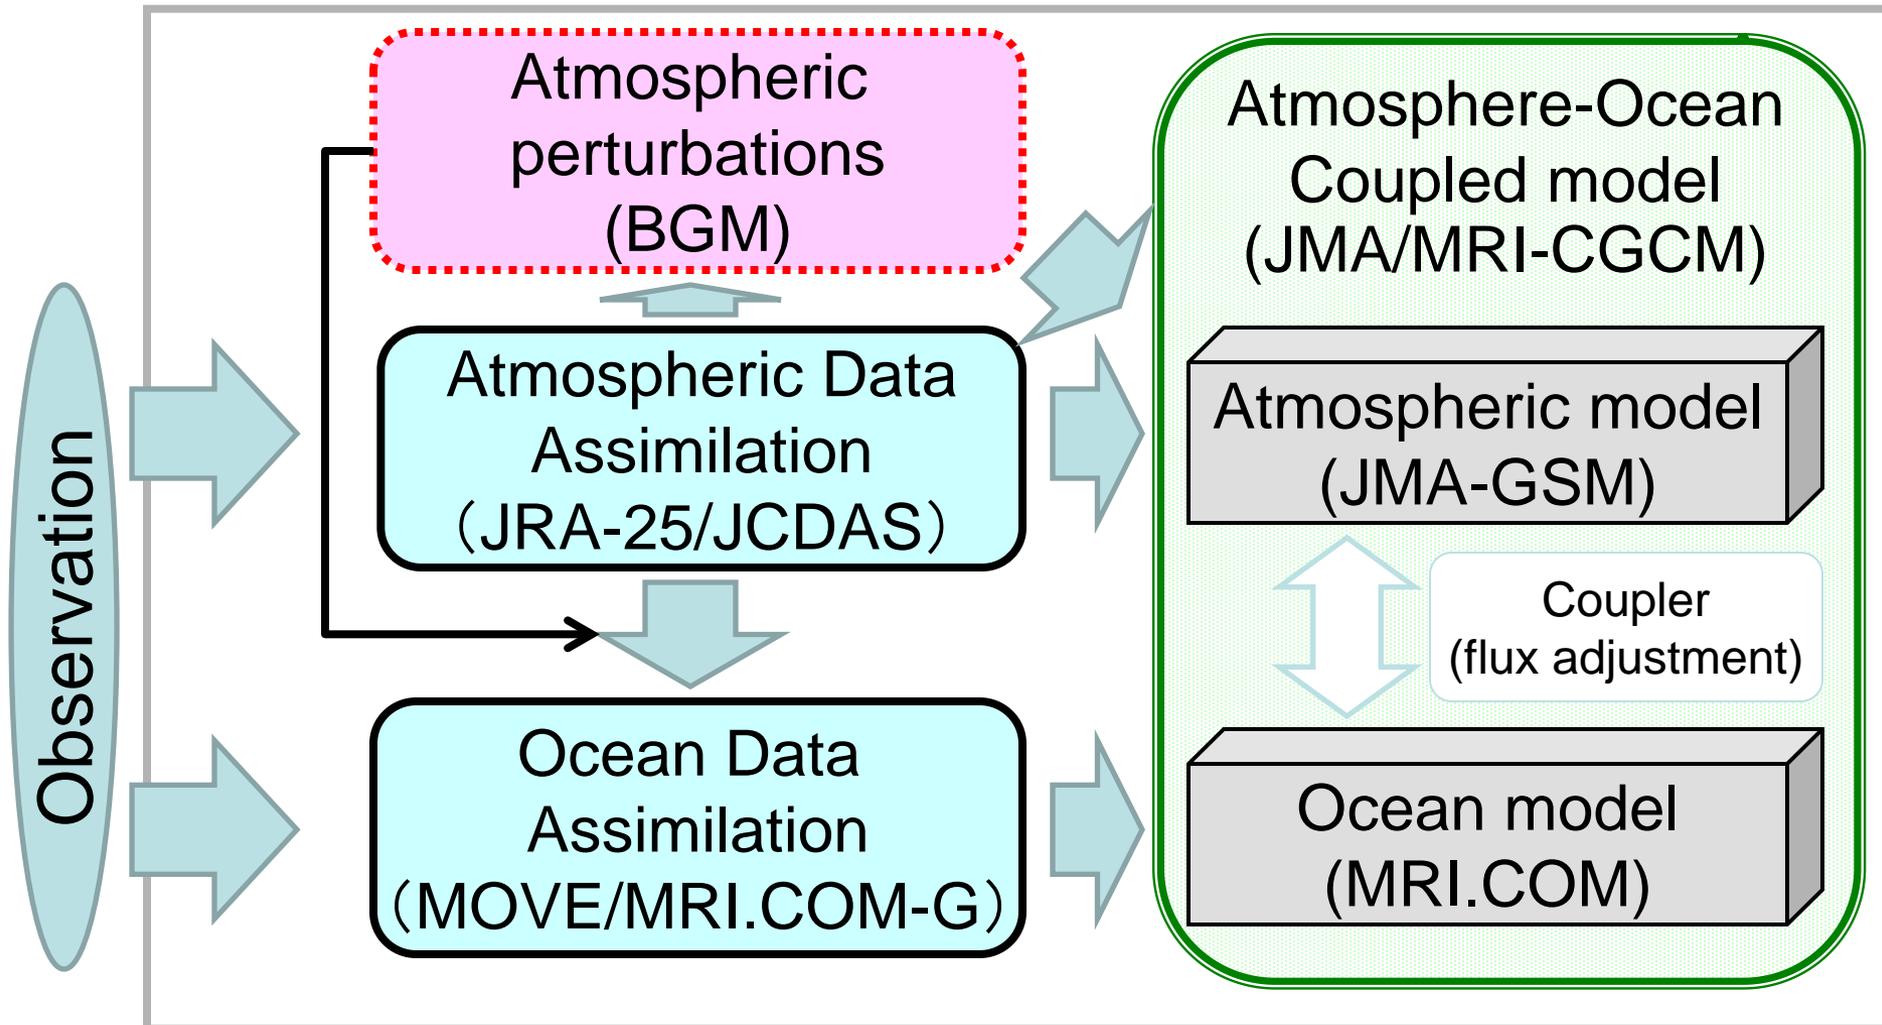

- 1.0deg in lon. X 0.3-1.0 deg in lat.
- 75N-75S, 0-360E
- L50
- Initial condition: MOVE/MRI-COM-G
- Initial perturbation: driven with BGM (TRO) of AGCM

ENSEMBLE: BGM&LAF

- Combination of BGM and LAF
- 9 members for each initial date
- Size: 51 (ENSO forecast: 30)
- Once a month

Schema of the new EPS

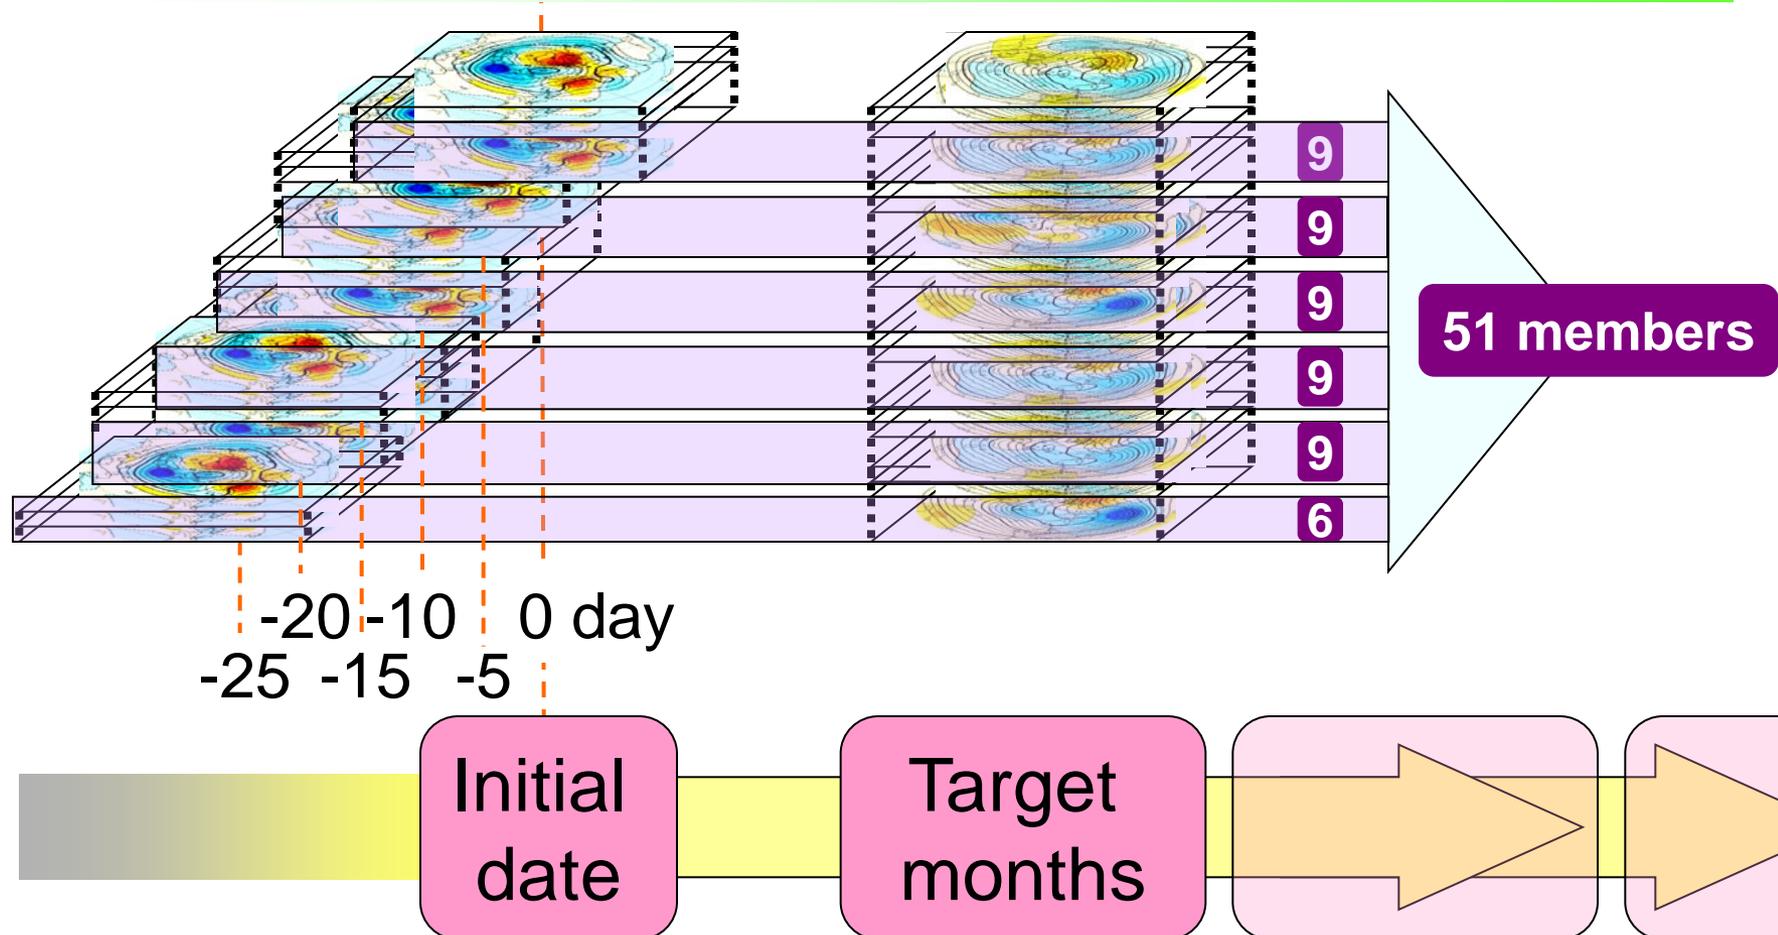

Schema of aggregation for the ensemble members

ENSEMBLE: BGM&LAF

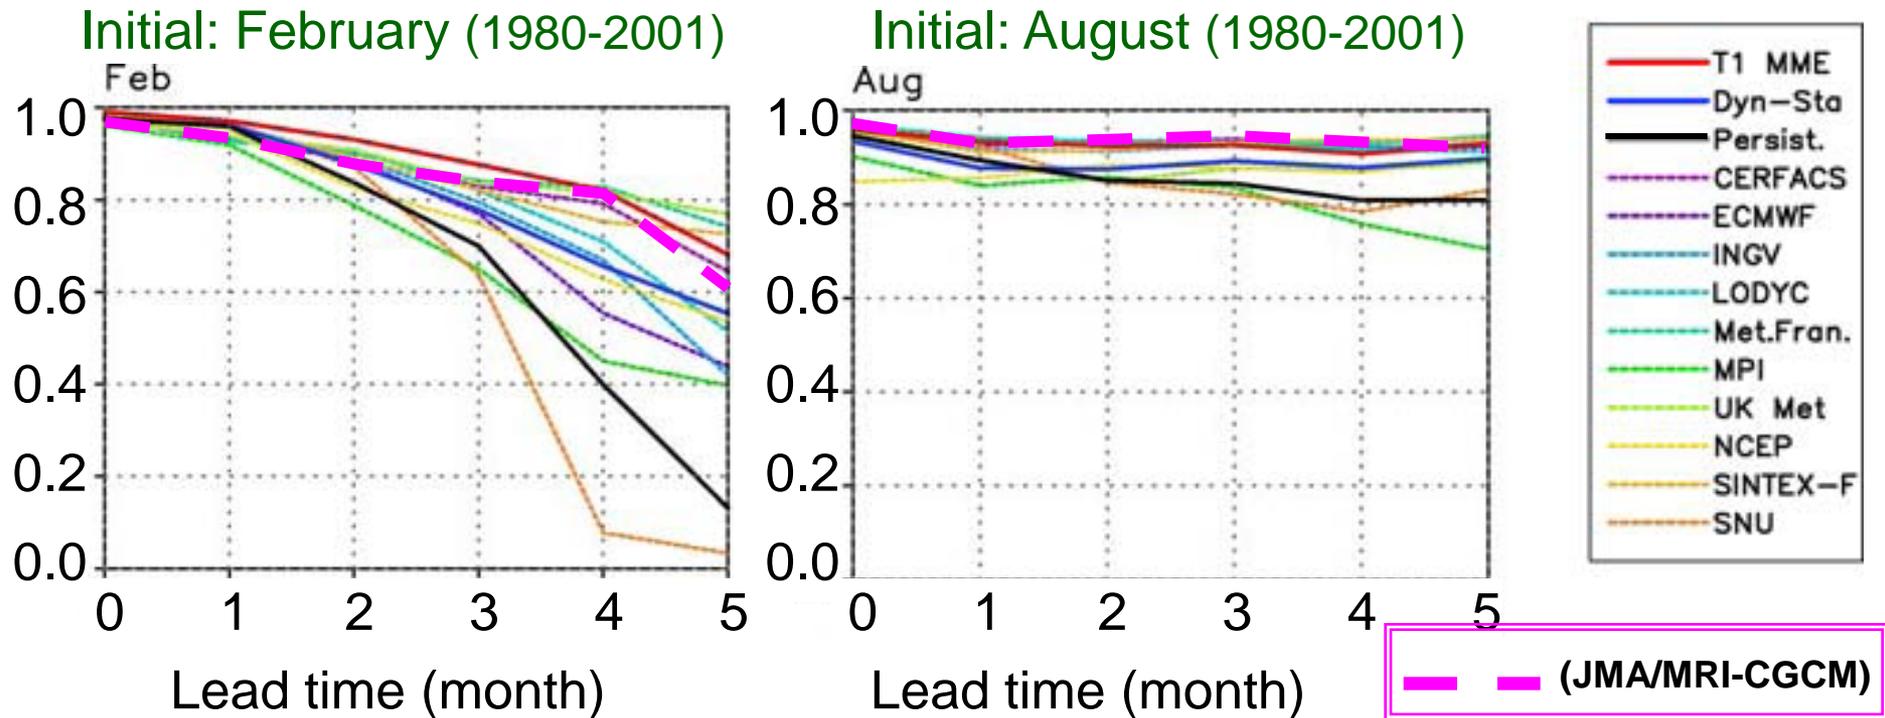

9 members for each initial date / Size: 51 (9 BGM, 5-day LAF(6 initials))

NINO.3.4 SST ACC: dependency on lead time

(quote from Fig. 8 of Jin et al. 2008)

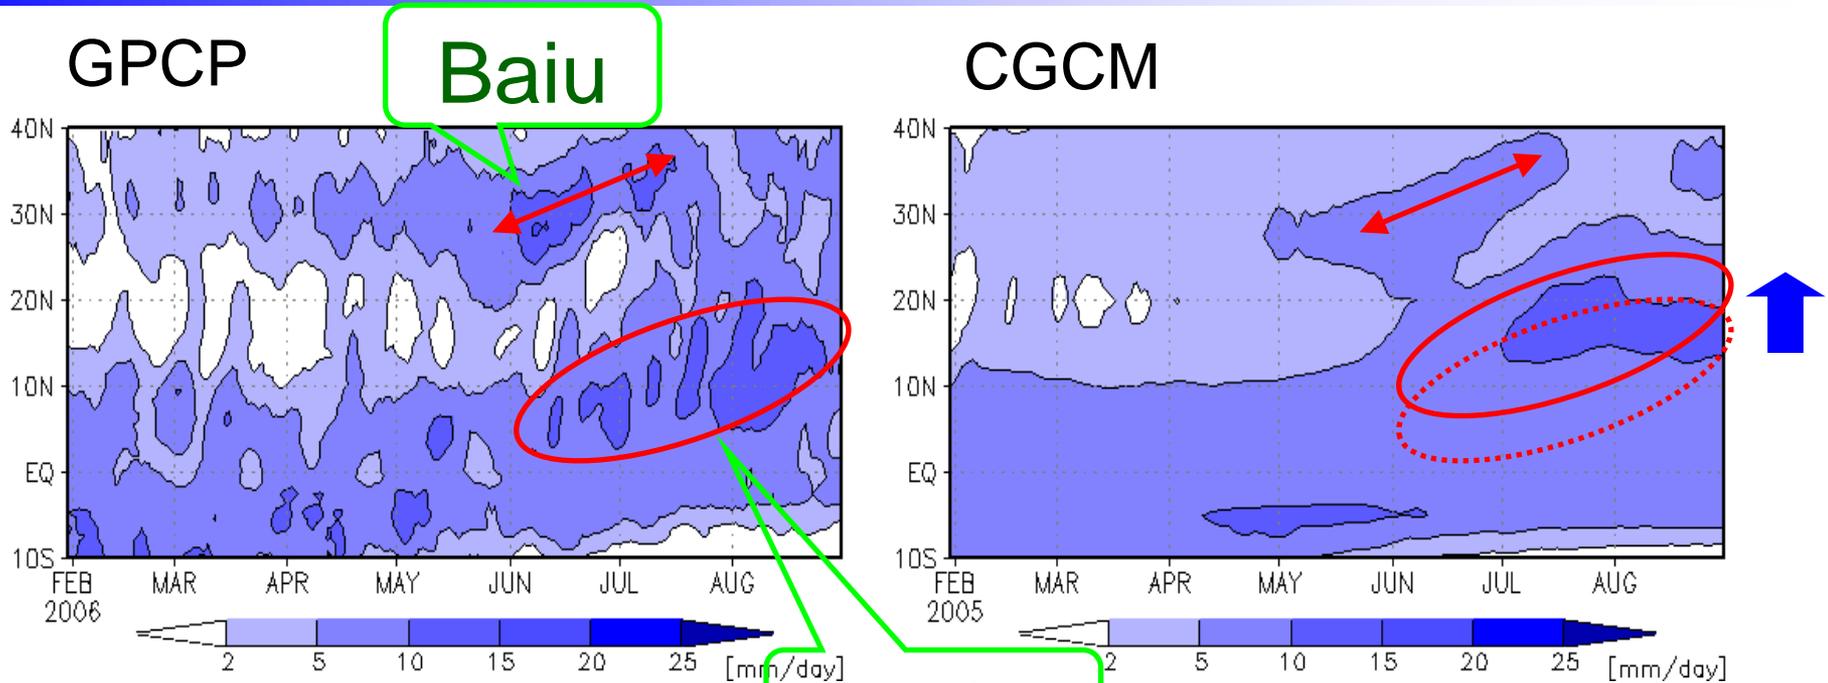

NINO.3.4 region: 120W-170W, 5S- 5N

Jin E. K., James L. Kinter III, B. Wang, C.-K. Park, I.-S. Kang, B. P. Kirtman, J.-S. Kug, A. Kumar, J.-J. Luo, J. Schemm, J. Shukla and T. Yamagata, 2008: Current status of ENSO prediction skill in coupled ocean-atmosphere models. *Clim. Dyn.*, **31**, 647-666.

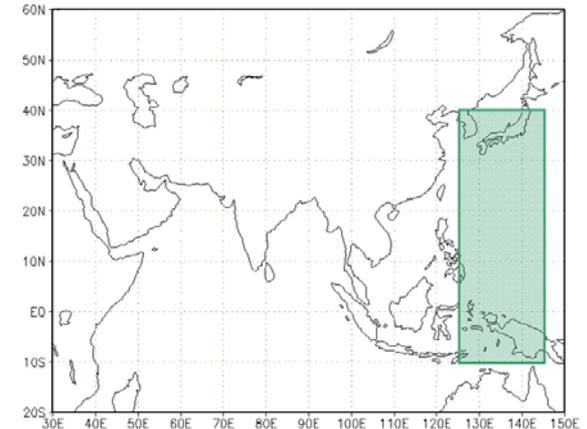

Seasonal Marching of Precipitation

(init. The end of Jan.)

Time-latitude cross section of the precipitation climatology averaged for 125–145° E.

The CGCM model well reproduces the seasonal marching of the Baiu.

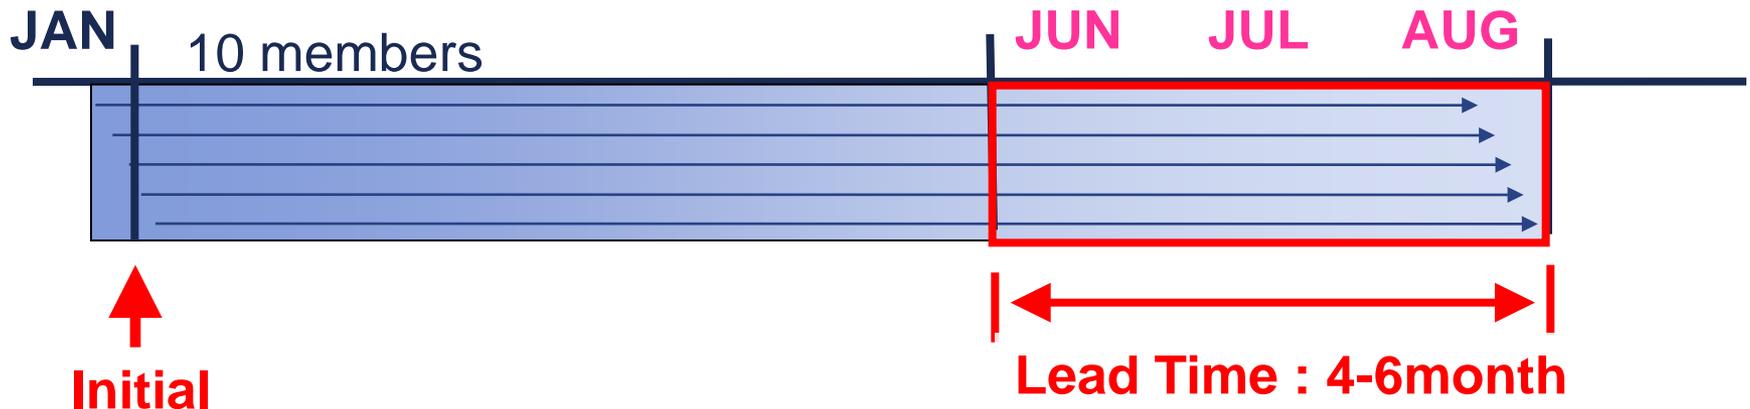

- 1. Introduction of the New Long Range Forecast system at JMA**
- 2. Performance Comparison of Old and New system**
- 3. Improvement of Numerical Guidance for the climate in Japan**

Hindcast Experiments Design

- The **CGCM** hindcast experiments are started from the end of January.
- Those of the **2-tier AGCM** are started from Feb. 10th.
- Period of the hindcast is 22 years (1984-2005).
- CO₂ concentration is updated during the hindcast period in CGCM.
- Sea-ices are fixed to the climatological values.

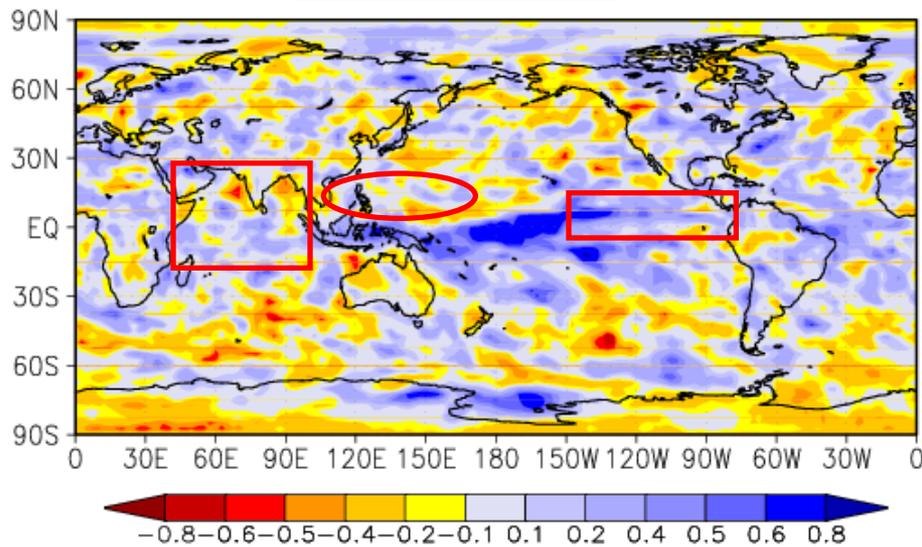

Improvement of precipitation

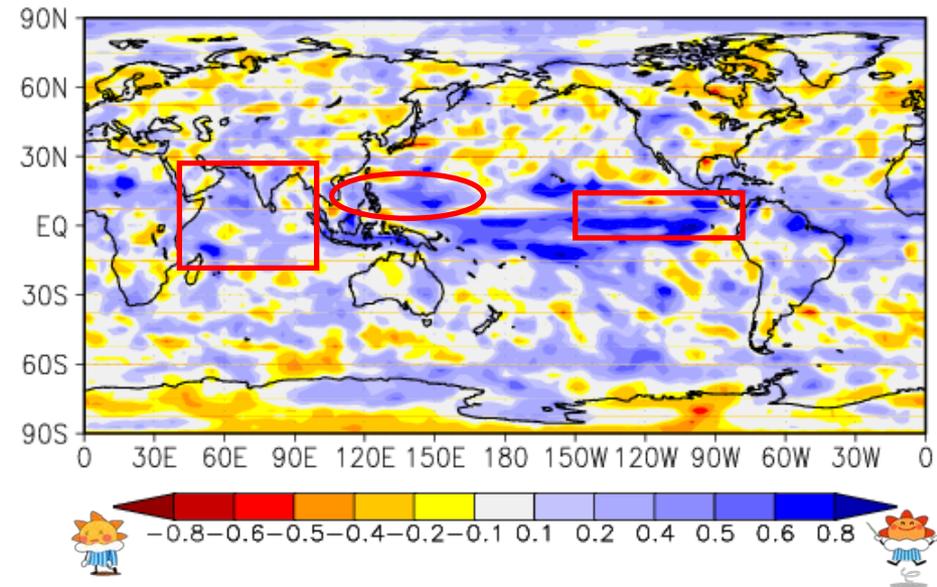

(JJA predictions, init. month of Feb.)

Anomaly correlation of precipitation (1984-2005)

Predictors

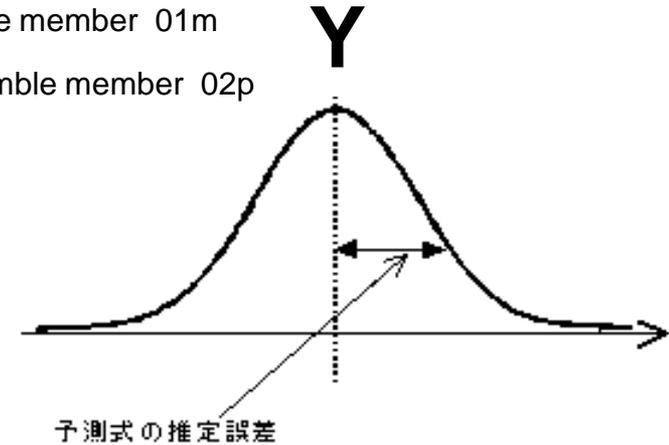

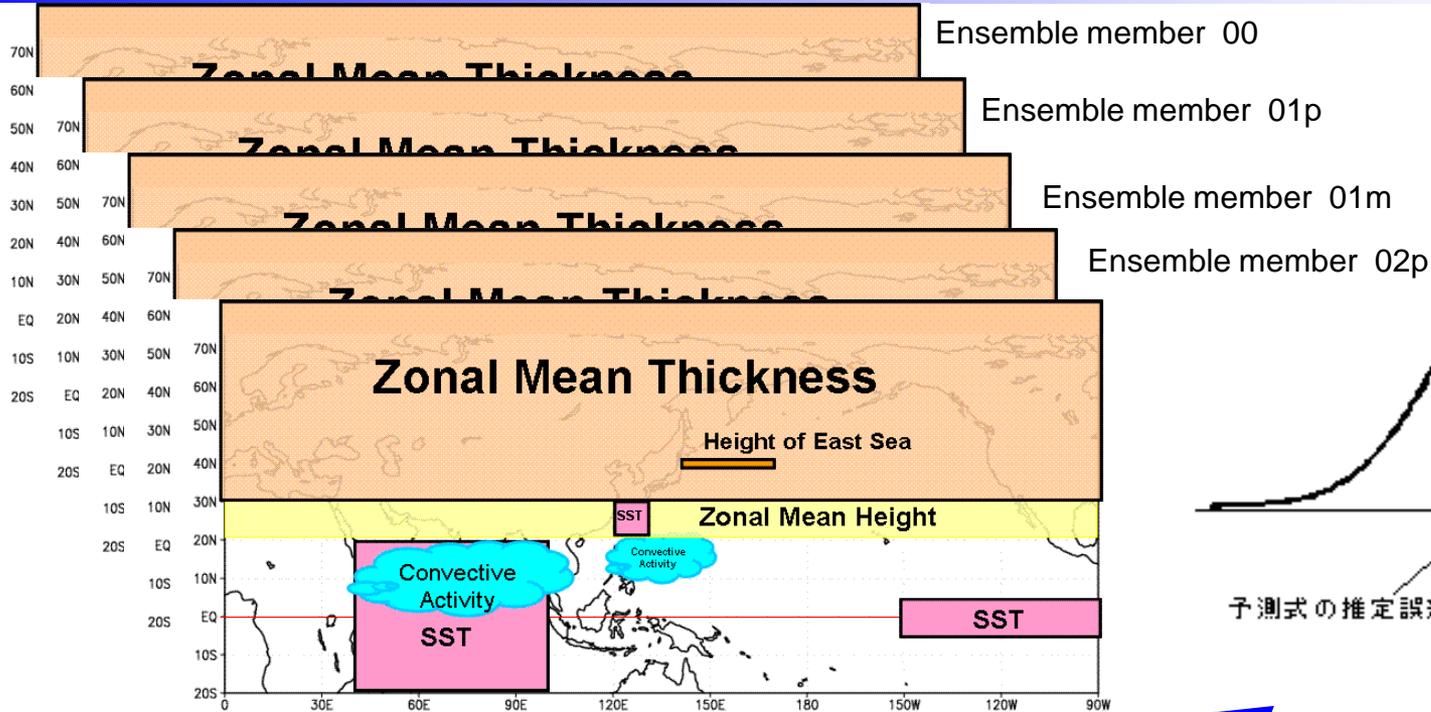

We considered the predictors to grasp signals of the tropical variation and global warming.

Predictands are surface temperature, precipitation and sunshine duration in Japan.

Methods of the Numerical Guidance (Model Output Statistics)

$$Y = A_i X_i + B$$

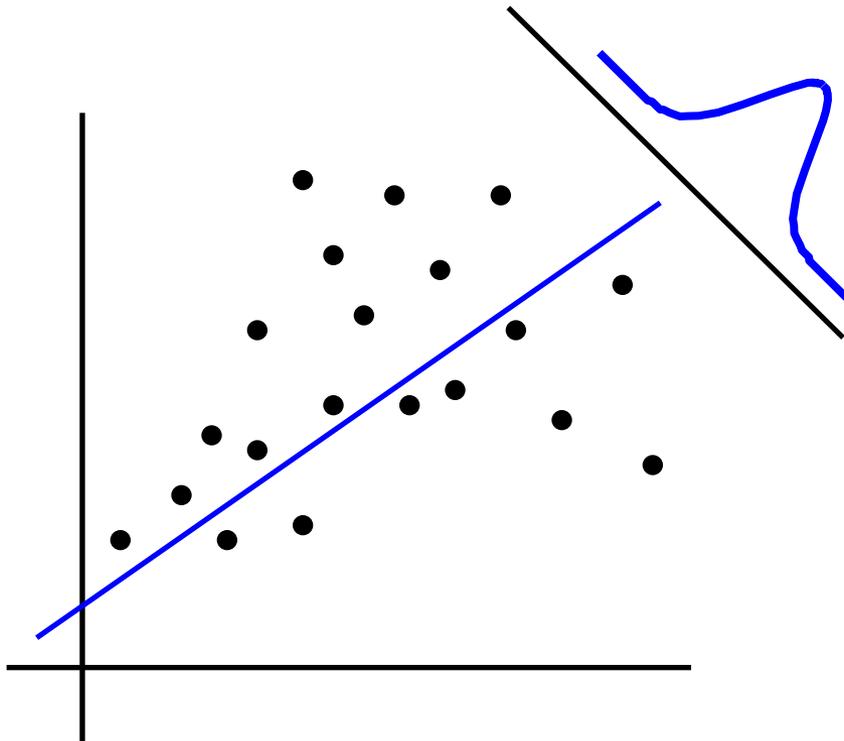

The ensemble mean predictors are applied to the multi-regression equations based on the output of the hindcast experiments.

A Normal distribution is assumed as probability density function.

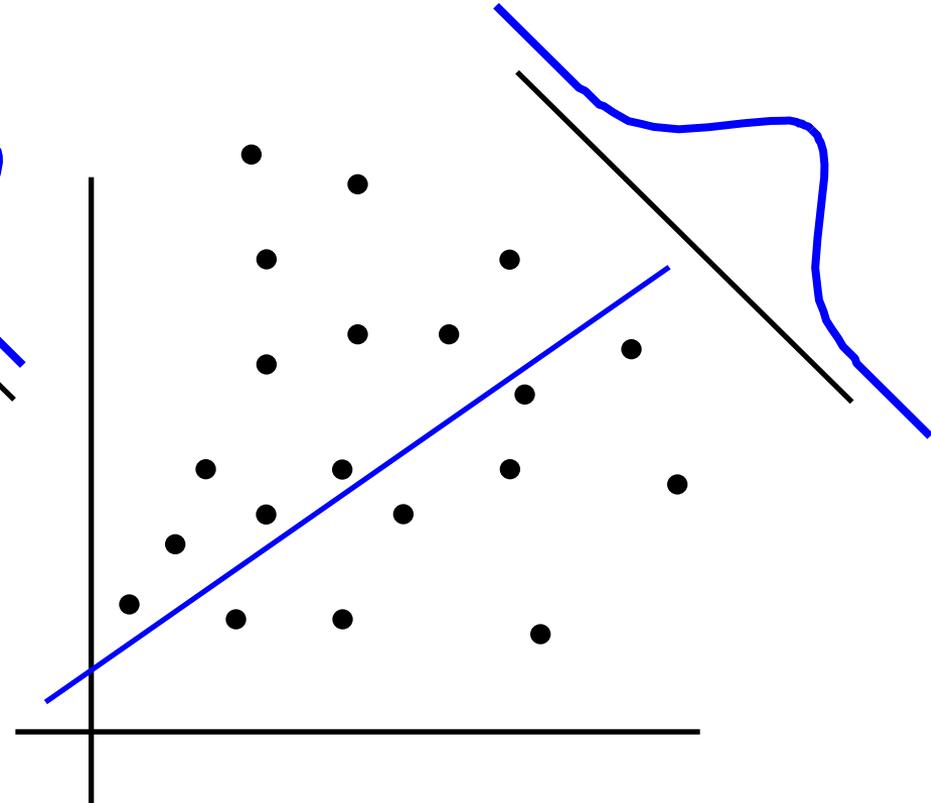

Relationship between predictors and predictands:

strong

weak

The predicted probability density function:

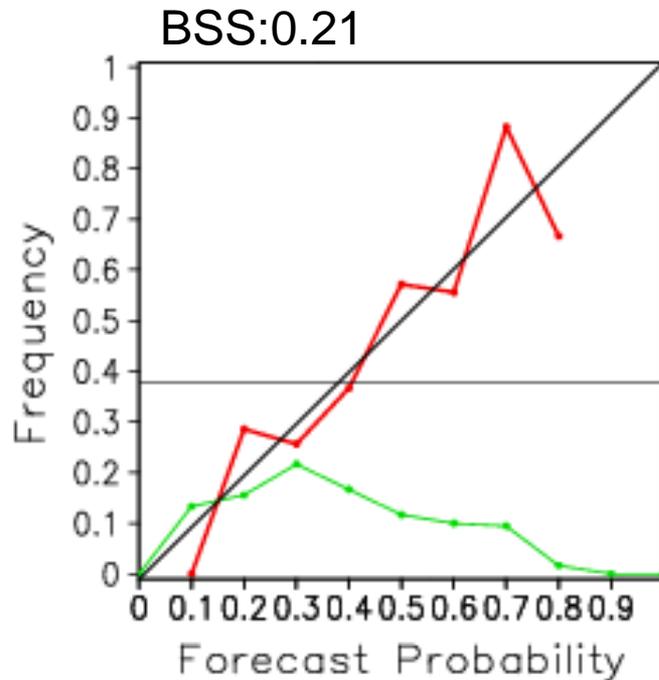

Sharpened distribution

Wide distribution

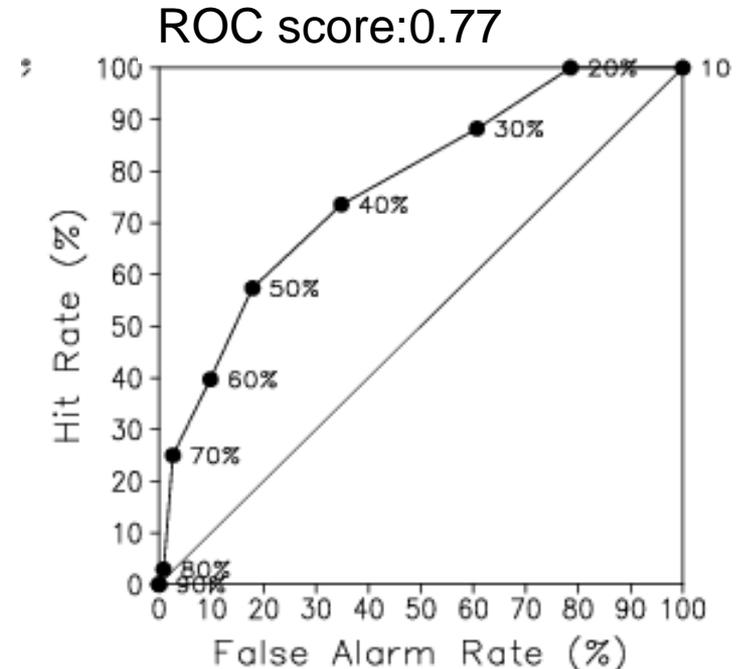

Skill of the Numerical Guidance (JJA temperature)

Reliability Diagram

Relative Operating Characteristics

The thresholds of tercile are determined so that the climatological chance of occurrence for each category is 33.3 % from 1971 to 2000.

- Target event: lower tercile and upper tercile
- Target periods: 1979-2008

JMA's Ensemble Prediction System

JMA operates a numerical prediction system composed of a global atmospheric circulation model and a land process model for summer/winter season forecasts. An ensemble prediction technique (which calculates atmospheric evolution from many different initial conditions) is employed to increase accuracy, and is applied to probabilistic forecasts. Ensemble prediction maps and verifications for summer/winter seasons prediction are available on this page. Experimental products of three-month probability forecasts are also available.

Notice

- GPV products for seasonal forecasts have been upgraded since 17 February 2010. Please refer to the top page of the "TCC News No. 19" for details.

Summary

- **JMA/MRI-CGCM shows far better forecast skill in the subtropical region compared with the old 2-tier system.**
- **We have developed the numerical guidance using MOS methods and it has a good reliability for summertime temperature.**
- **We offer verification results of hindcasts in addition to the forecast maps and GPVs of the CGCM at Tokyo Climate Center website.**

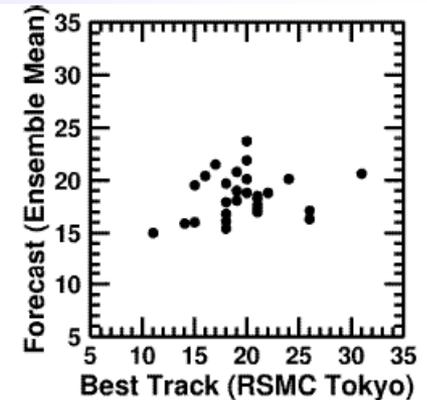

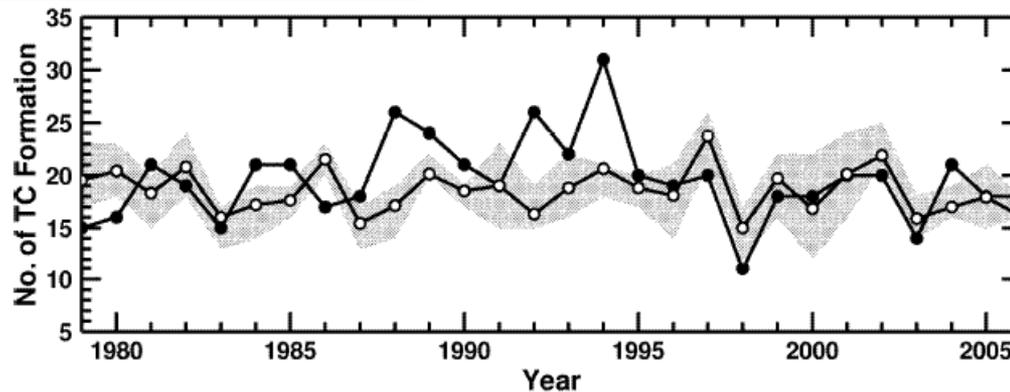

Thank you for your attention!

Dynamical Seasonal Prediction of Typhoons (quote from Takaya et al. 2008)

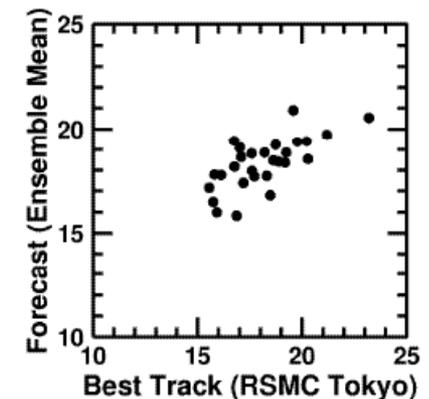

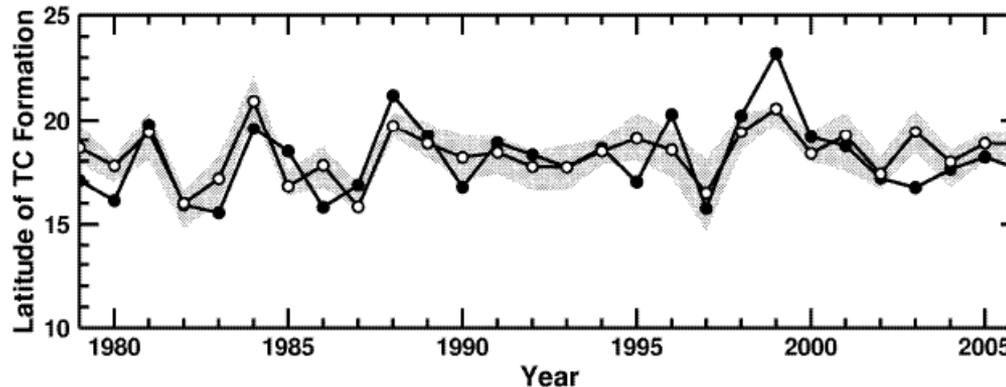

Number of TC formation

The upper figure shows the forecast result of the number of TC formation in the western North Pacific.

Open circles denote prediction.

Mean latitude of TC formation

The lower figure shows the interannual variability of the mean latitude of TC formation

Lead-Time (Month)

Replace EPS for seasonal predictions in February 2010

- **Introducing** the atmosphere-ocean coupled model (**CGCM**) into operational seasonal prediction

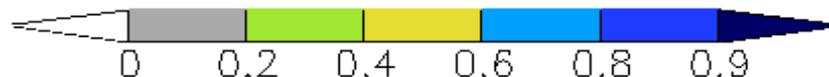

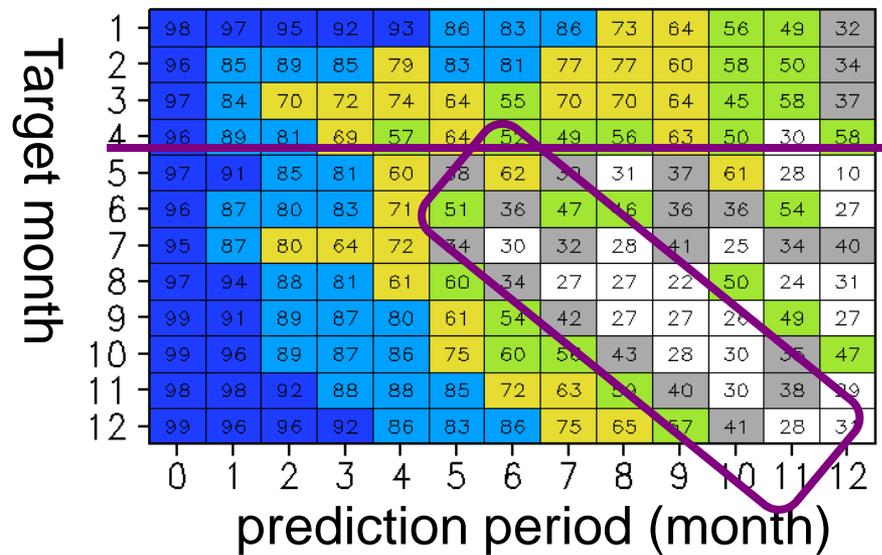

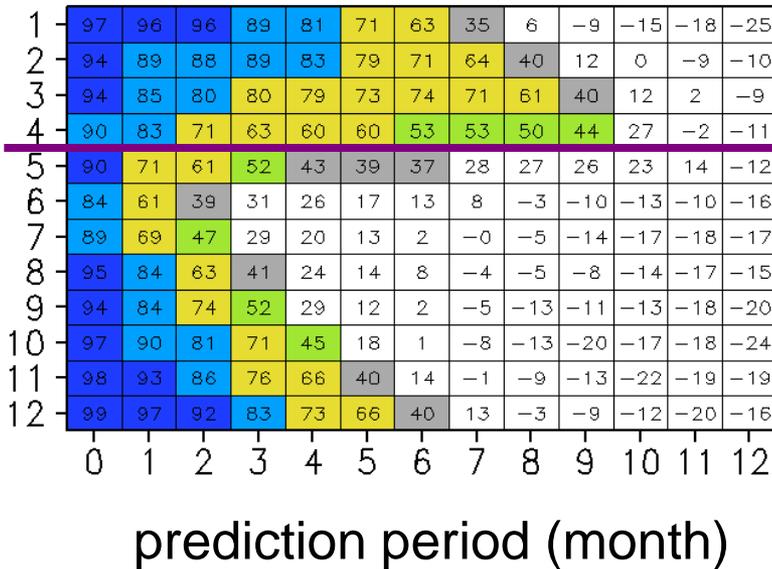

Anomaly Correlation of NINO.3.4 SST in the JMA's CGCM

Prediction skill has target month dependency.

- Persistence barrier from spring to summer
- Anomaly correlation is small for model from spring to summer.
= **“spring barrier”** ; common issues for all numerical model

Persisted anomaly

CGCM

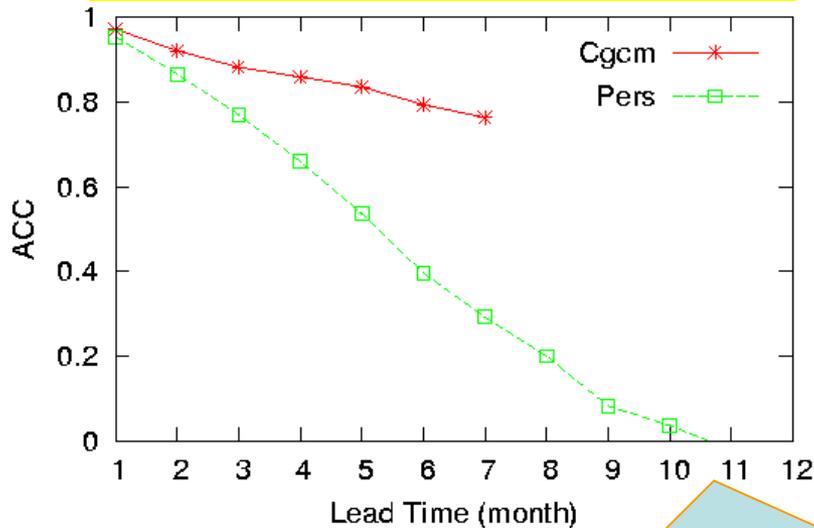

period: 1979~2007

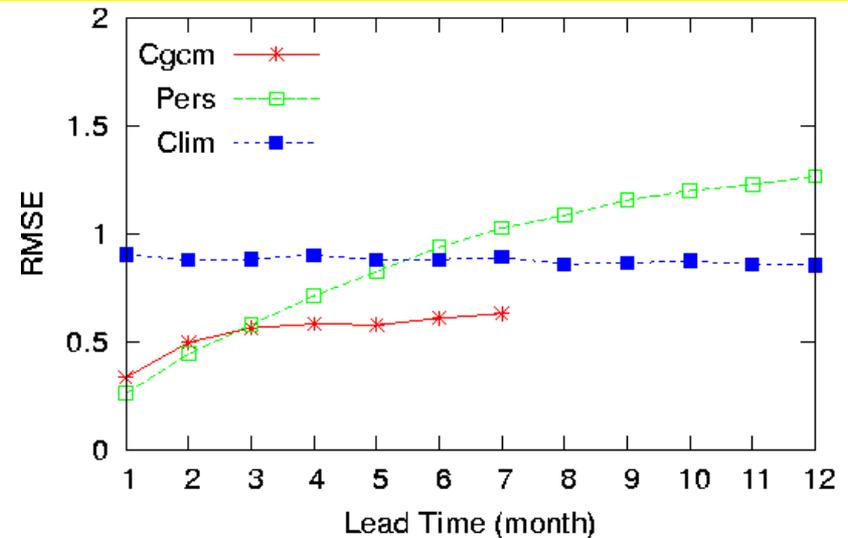

ENSO forecast skill of JMA/MRI -CGCM3

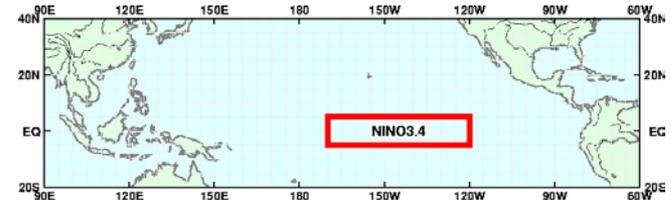

(a) Anomaly Correlation (ACC)

(b) Root Mean Square Error (Deg.C.) (RMSE)

• ACC with CGCM are higher than 0.8 within 5-6 month lead time and higher than that with persistence forecast not only for long but also for short lead times.

a) Anomaly correlation coefficients and b) RMSE of NINO3.4 index during 1984-2005 with respect to lead time after removing the mean bias. Red lines for JMA/MRI-CGCM, green lines for persistence forecast and a blue line for standard deviation of NINO3.4

Reliability diagram

The reliability diagram plots the observed frequency(Y-axis) against the forecast probability(X-axis).

The diagonal line indicates perfect reliability (observed frequency equal to forecast probability for each category).

Points below(above) the diagonal line indicate overforecasting (underforecasting).
