

# Monitoring and prediction of El Niño and La Niña

Akio NARUI

*El Niño Monitoring and Prediction Group*

*Climate Prediction Division*

*Japan Meteorological Agency*

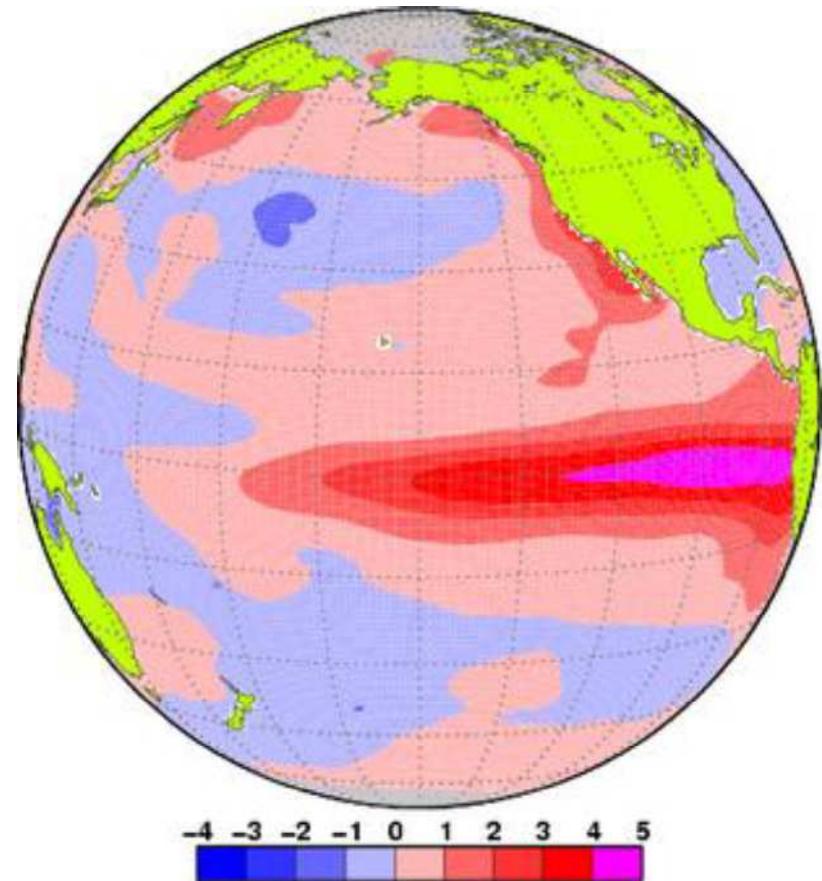

# Outline

1. Introduction of El Niño and La Niña phenomena
2. JMA's system for El Niño monitoring and prediction
3. Current conditions and outlook
4. TCC products for El Niño monitoring and prediction

# 1. Introduction of El Niño and La Niña phenomena

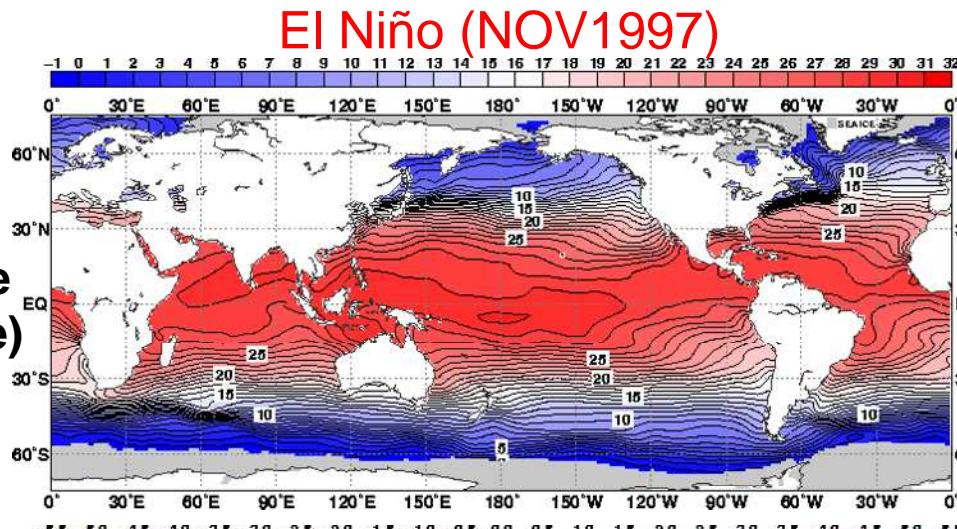

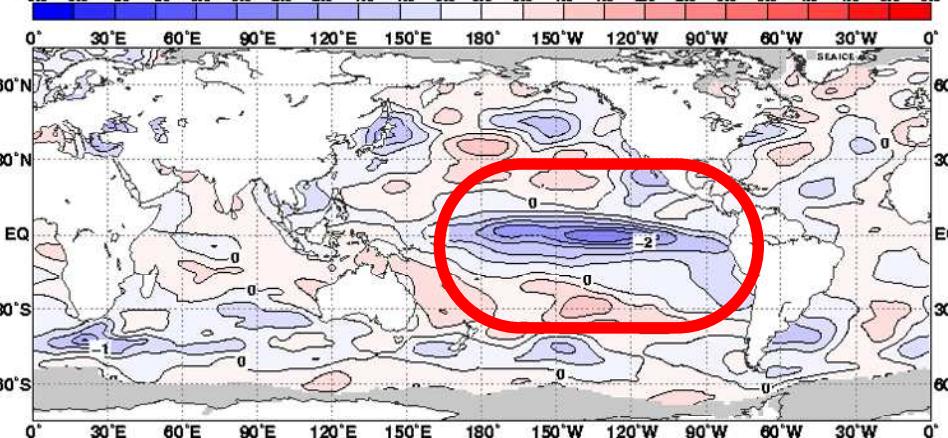

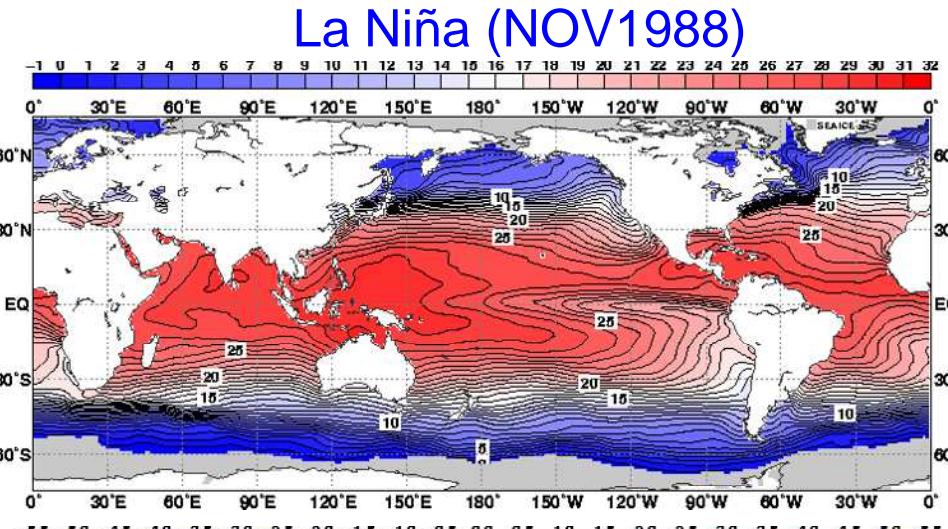

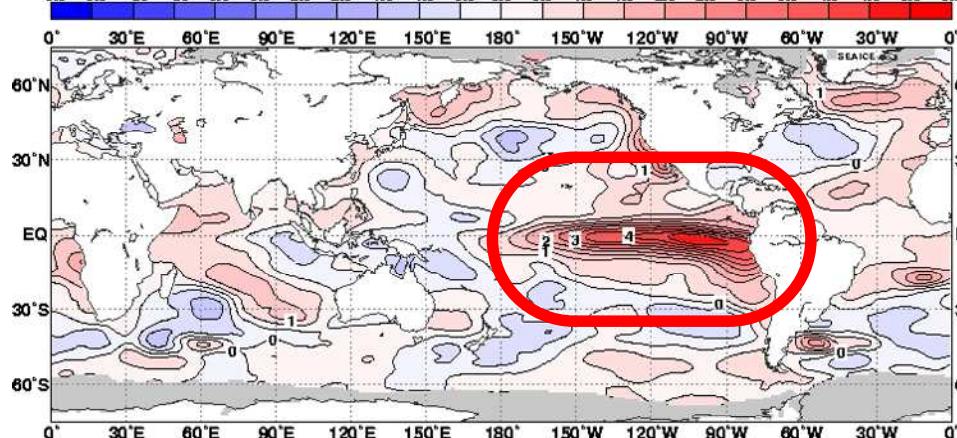

# “El Niño”(“La Niña”) refers to:

Large-scale ocean phenomena in which eastern equatorial Pacific (off the coast of Peru) SSTs are warmer(cooler) **than normal**.

SST  
(sea surface  
temperature)

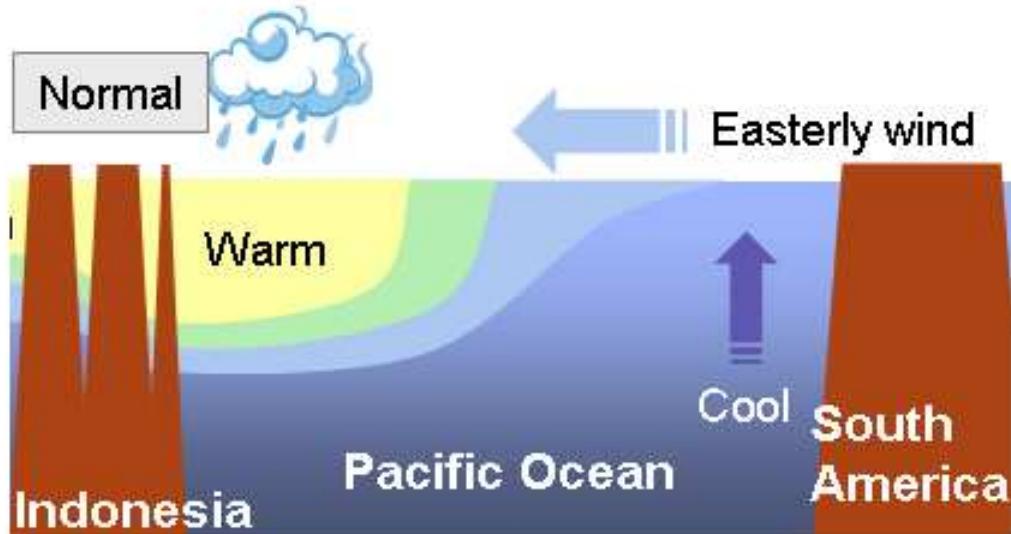

SST  
anomaly

# What happens during El Niño?

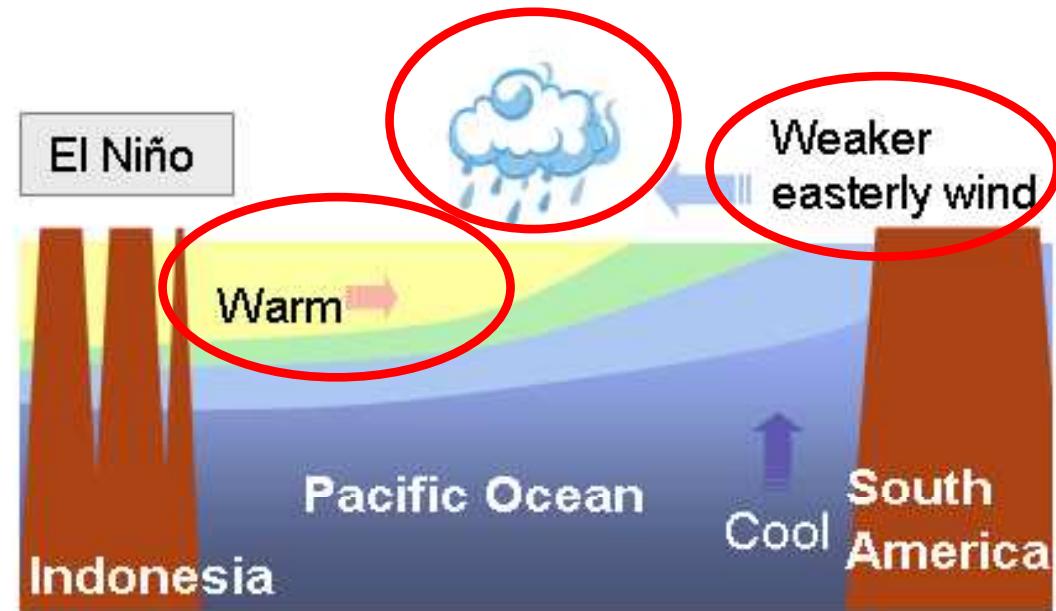

In the equatorial pacific,

- ① The easterly **wind** weaken.
- ② **Warm water** move eastward.
- ③ The region of heaviest **rainfall** moves eastward.  
→ We have to monitor these characteristics.

Normal condition

# Quantitative definition of El Niño (La Niña) event

## - Definition by JMA

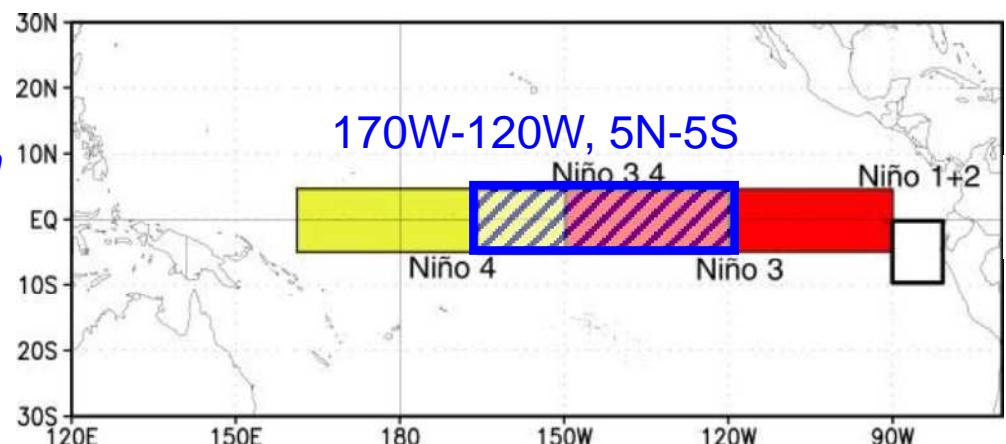

*5-month running mean of NINO.3 (5N-5S, 150W-90W) SST deviation stays 0.5K or higher (-0.5K or lower) for 6 consecutive months or longer.*

*NINO.3 SST deviation is defined as deviation from the latest 30-year (e.g. 1982-2011 for the year 2012) average (not from 1981-2010 normal).*

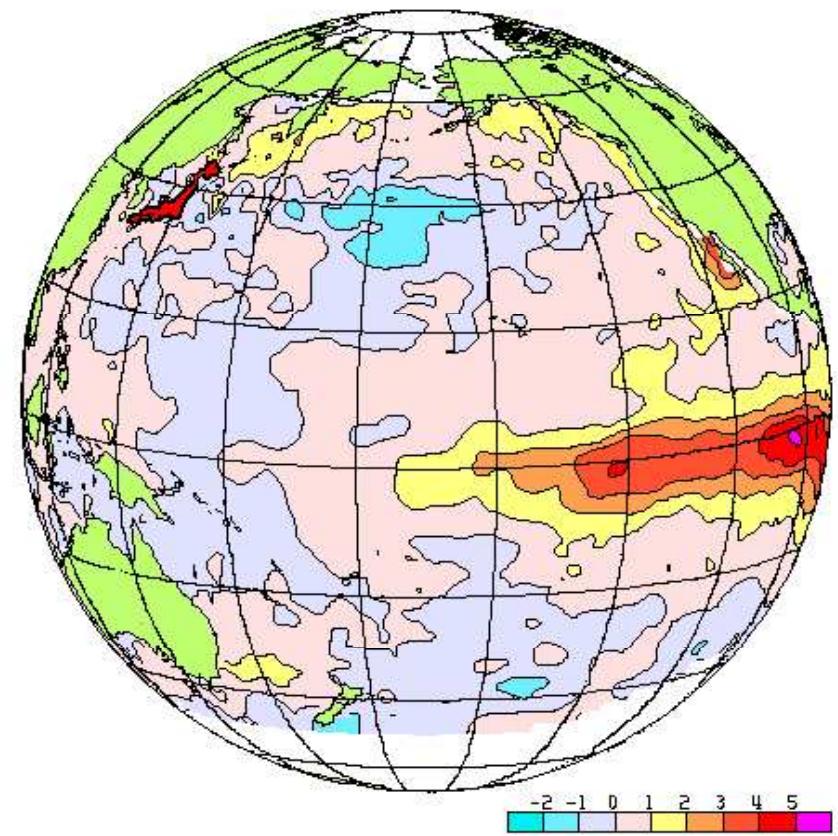

By use of sliding normal, long term trends is eliminated.

## Definition by NOAA

*3-month running mean of NINO.3.4 SST deviation from normal stays more than 0.5K (less than -0.5K) for the consecutive period longer than 5 months.*

## 2. JMA's system for El Niño monitoring and prediction

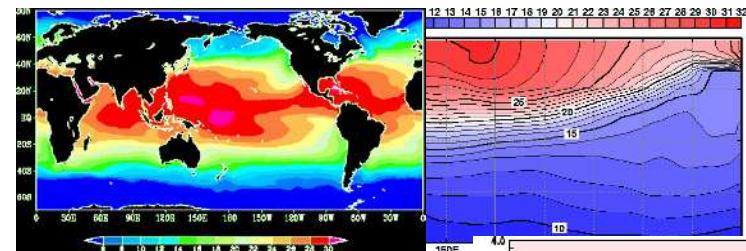

# Workflow for monitoring and prediction

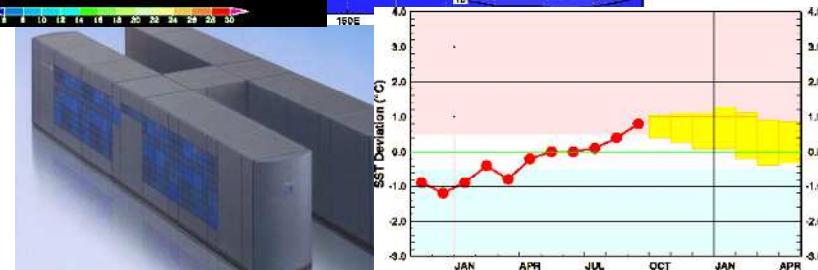

1. Acquiring observing data  
(temperature, salinity)

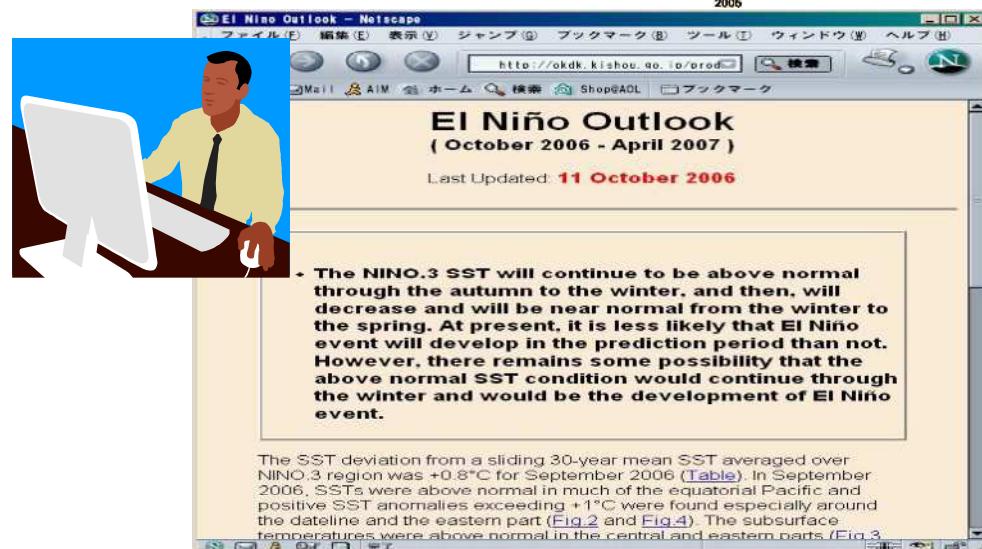

2. Data quality control & assimilation  
into the regular grids

3. Numerical prediction  
(Atmosphere-Ocean coupled model)

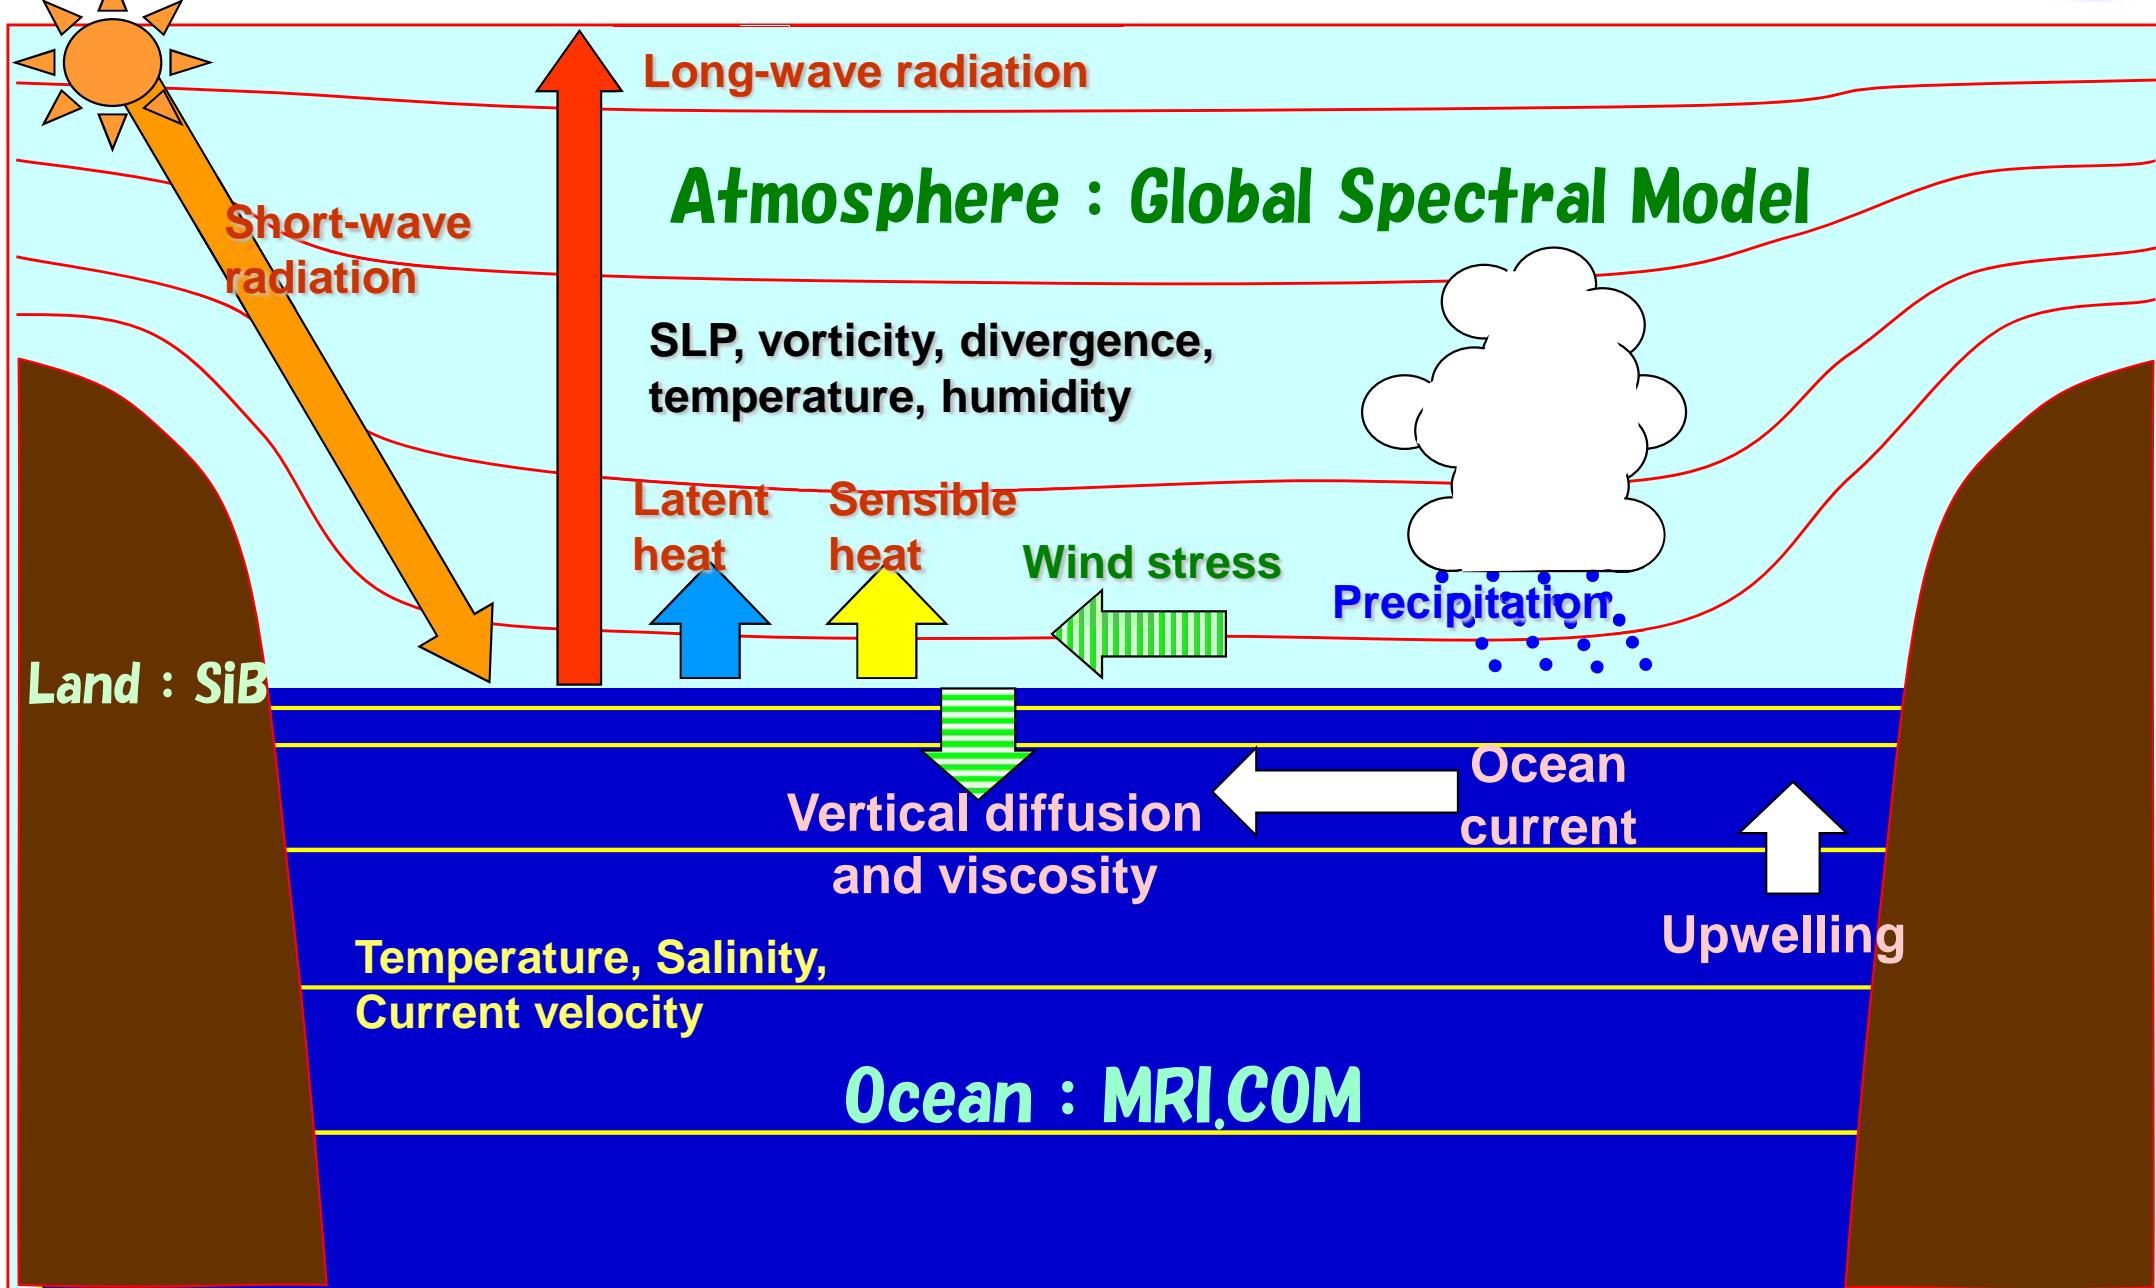

4. Analysis & examination of the  
model results

5. Products publication

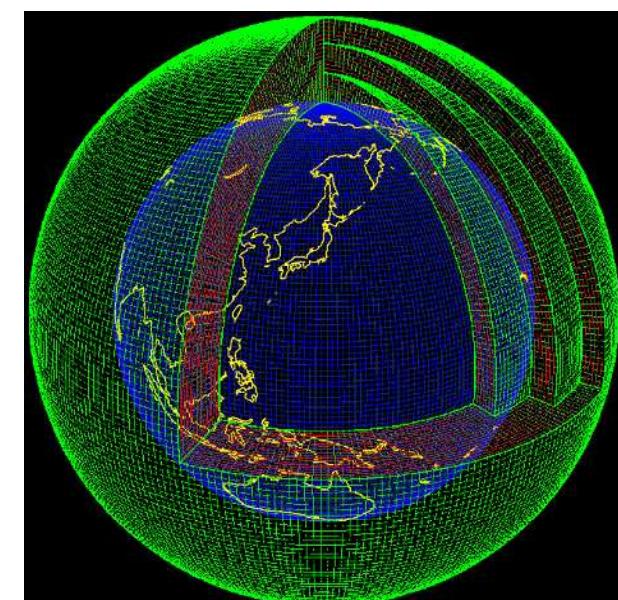

# Atmosphere-Ocean coupled prediction model

# Prediction model specifications

- Atmospheric component : spectral model ( $T_L 95$ , 192x96 grids, 40 vertical levels)
- Ocean component : grid model (1deg x 0.3 to 1deg, 50 vertical levels)
- Initial condition :
  - [atmosphere] provided by JCDAS (JMA Climate Data Assimilation System)
  - [ocean] provided by MOVE-G
- Prediction period : up to 7 months ahead
- 51-member ensemble forecast

# The latest conditions in the equatorial Pacific Ocean

SSTA OCT. 2012

Analyses of the equatorial Pacific Ocean conditions for Oct, 2012. SST anomaly (left, upper) and vertical section of temperature anomaly along the equator (left, lower), longitude-time section of OHC anomaly (center), longitude-time section of wind stress anomaly (right).

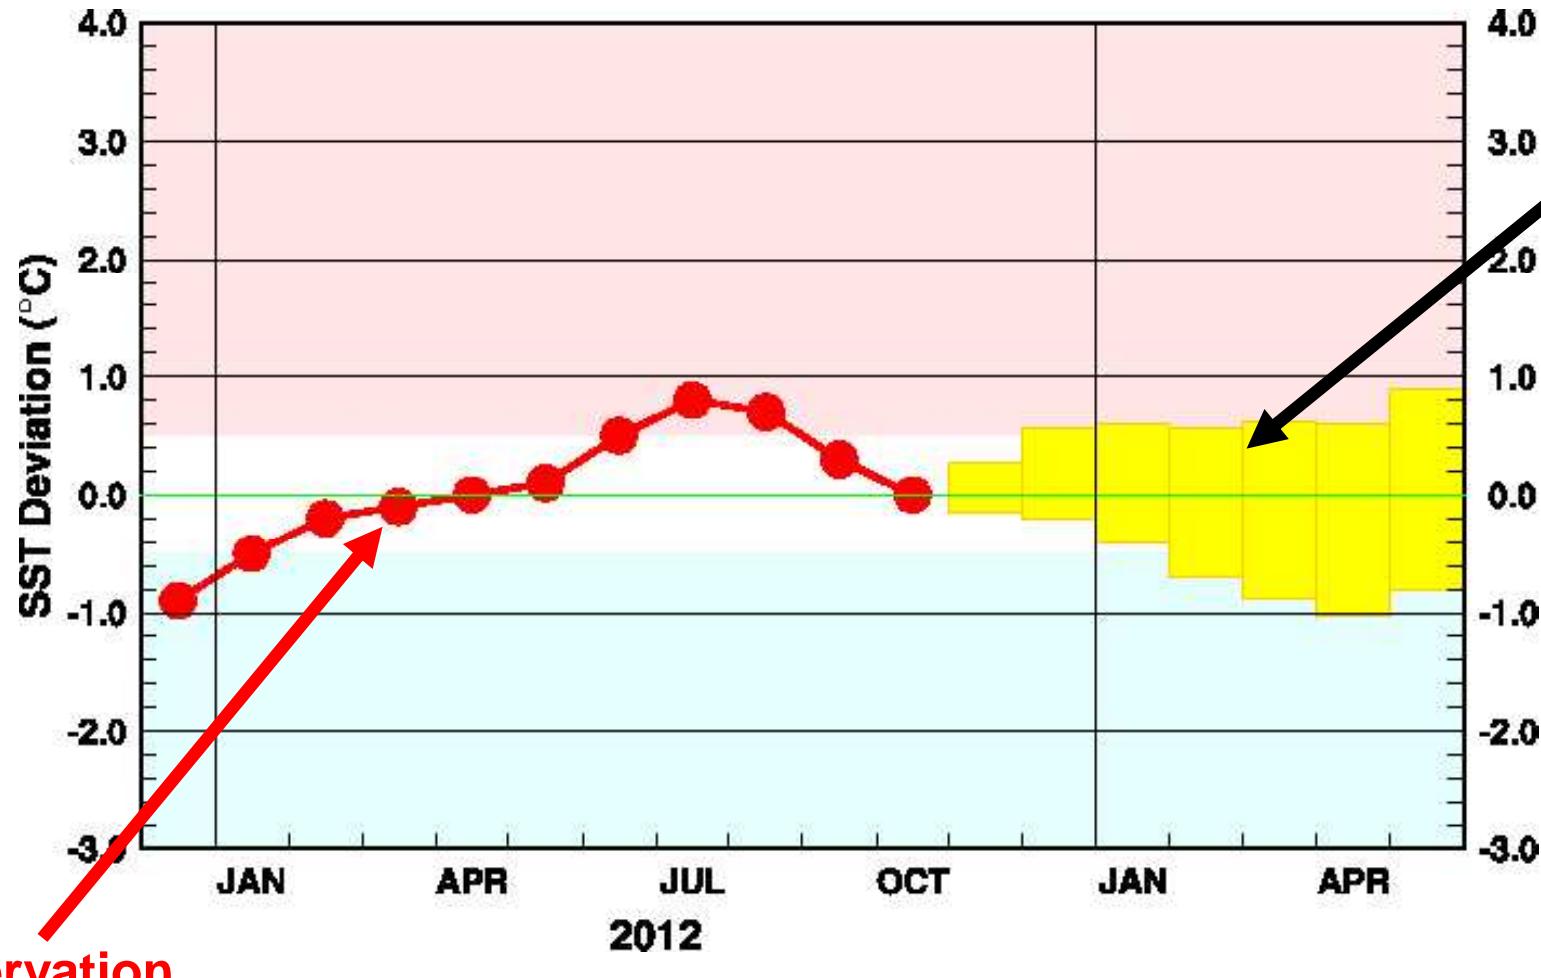

**OHC**(ocean heat content) : water temperature vertically averaged from the surface to 300m depth.

# Model prediction (JMA/MRI-CGCM)

<http://ds.data.jma.go.jp/tcc/tcc/products/elnino/outlook.html>

## NINO.3 SST deviation from 30-year sliding mean

Observation.

Each box denotes the range where the SST deviation will be included with the 70% or more probability.

NINO.3 SST will be near normal during the prediction period.

# The latest El Niño outlook from JMA (Nov.2012)

- El Niño conditions transitioned to ENSO neutral conditions in the equatorial Pacific.
- It is likely that ENSO neutral conditions will continue until the northern hemisphere spring.

<http://ds.data.jma.go.jp/tcc/tcc/products/elniño/outlook.html>

## *Outlook by NOAA CPC*

**Synopsis: ENSO-neutral is favored through the Northern Hemisphere winter 2012-13.**

[http://www.cpc.ncep.noaa.gov/products/analysis\\_monitoring/enso\\_advisory/ensodisc.pdf](http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/enso_advisory/ensodisc.pdf)

## 4. TCC products for El Niño monitoring and prediction

You can get a lot of information on El Niño or La Niña in the TCC web site. You can monitor the current conditions of El Niño or La Niña and get the prediction of El Niño or La Niña as I mentioned before.

# El Niño outlook (monthly)

<http://ds.data.jma.go.jp/tcc/tcc/products/elniño/outlook.html>

## El Niño Outlook

( November 2012 - May 2013 )

Last Updated: 9 November 2012

- El Niño conditions transitioned to ENSO neutral conditions in the equatorial Pacific.
- It is likely that ENSO neutral conditions will continue until the northern hemisphere spring.

### [El Niño / La Niña]

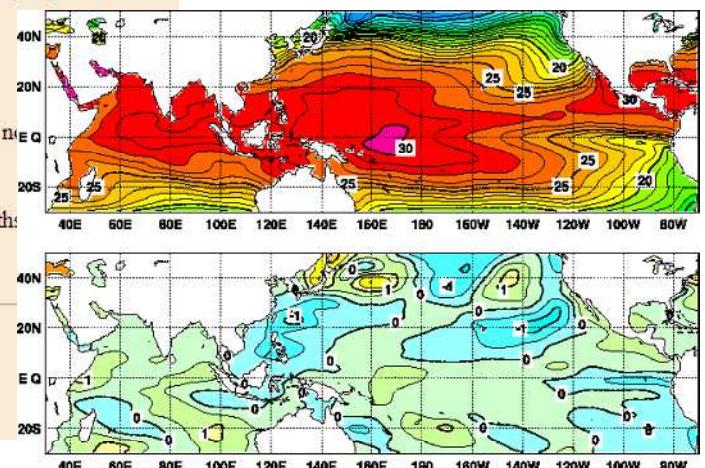

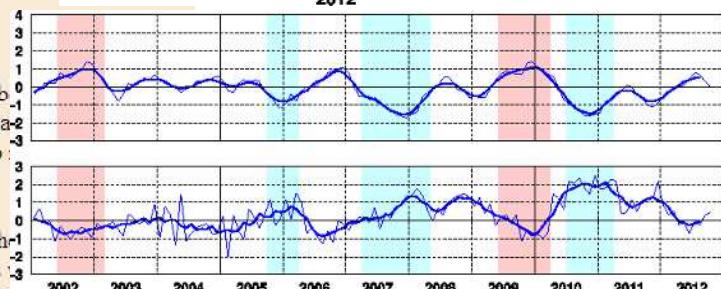

In October 2012, the NINO.3 SST deviation was  $0.0^{\circ}\text{C}$  ([Table](#) and [Fig.1](#)). SSTs in the equatorial Pacific were above normal in the western part and below normal in the eastern part ([Fig.2](#) and [Fig.4](#)). Subsurface temperatures were above normal from the western to the central parts and below normal in the eastern part ([Fig.5](#)). In the atmosphere, the convective activities were near normal in the equatorial Pacific ([Fig.6](#)). Easterly winds in the lower troposphere were also near normal in the equatorial Pacific ([Fig.7](#), [Fig.8](#)). These oceanic and atmospheric conditions indicate ENSO neutral conditions.

The JMA's El Niño prediction model predicts that the NINO.3 SST will be mostly near normal during the prediction period ([Fig.9](#)). However, taking the subsurface warmer waters from the western to the central parts and the prediction uncertainties into account, it remains possible that El Niño conditions will develop during the northern hemisphere winter and spring. Considering all the above, while possibilities of redevelopment of El Niño conditions during winter and spring cannot be ruled out, it is more likely that ENSO neutral conditions will continue until spring.

### [Western Pacific and Indian Ocean]

The SST in the tropical western Pacific (NINO.WEST) region was below normal in October ([Fig.1](#)). It is likely that the NINO.WEST SST will be near normal or slightly below normal in the months ahead ([Fig.10](#)).

The SST in the tropical Indian Ocean (IOBW) region was near normal in October ([Fig.1](#)). It is likely that the IOBW SST will be near normal in the months ahead ([Fig.11](#)).

## El Niño impact on the world climate

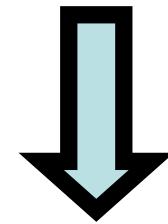

The map shows the regions where climate tendencies observed during El Niño episodes is statistically significant in boreal winter.

# Information on oceanic conditions in the western equatorial Pacific and the Indian Ocean

- Model and assimilation improved
- Ocean observations increased

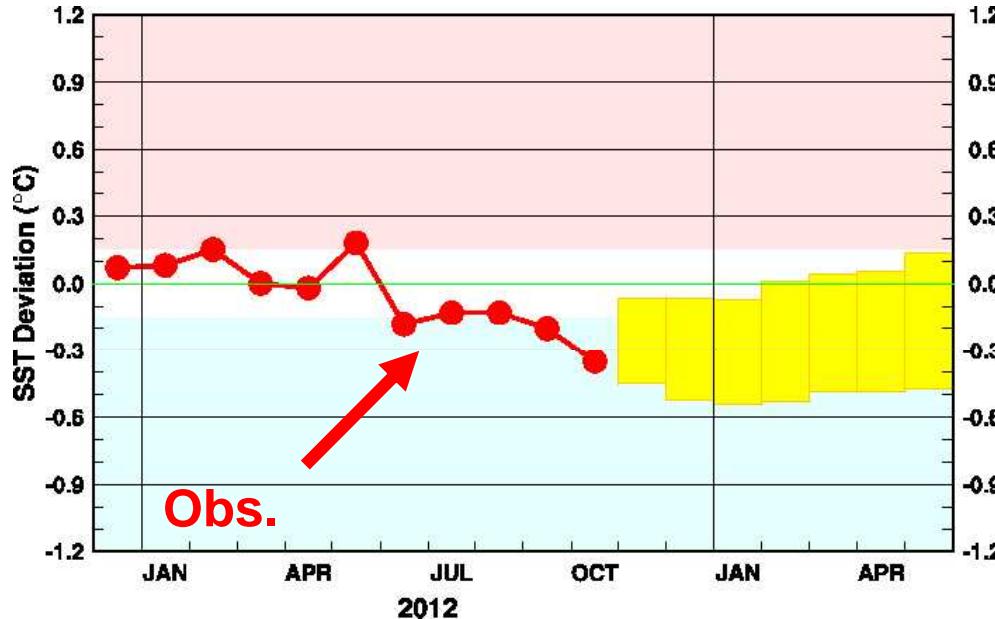

Region for monitoring and outlook was expanded in 2009

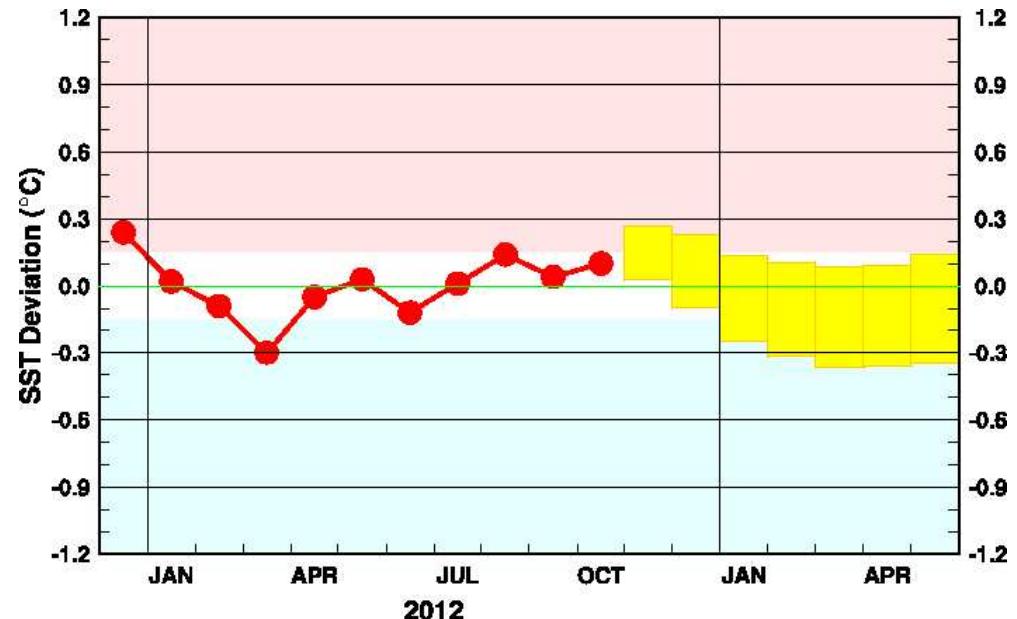

IOBW SST deviation tends to lag about a couple of months behind NINO.3.

NINO.WEST SST deviation tends to vary with NINO.3, with an opposite sign.

# Prediction of NINO.WEST and IOBW

SST deviations for **NINO.WEST** after removed the linear trend in 30years

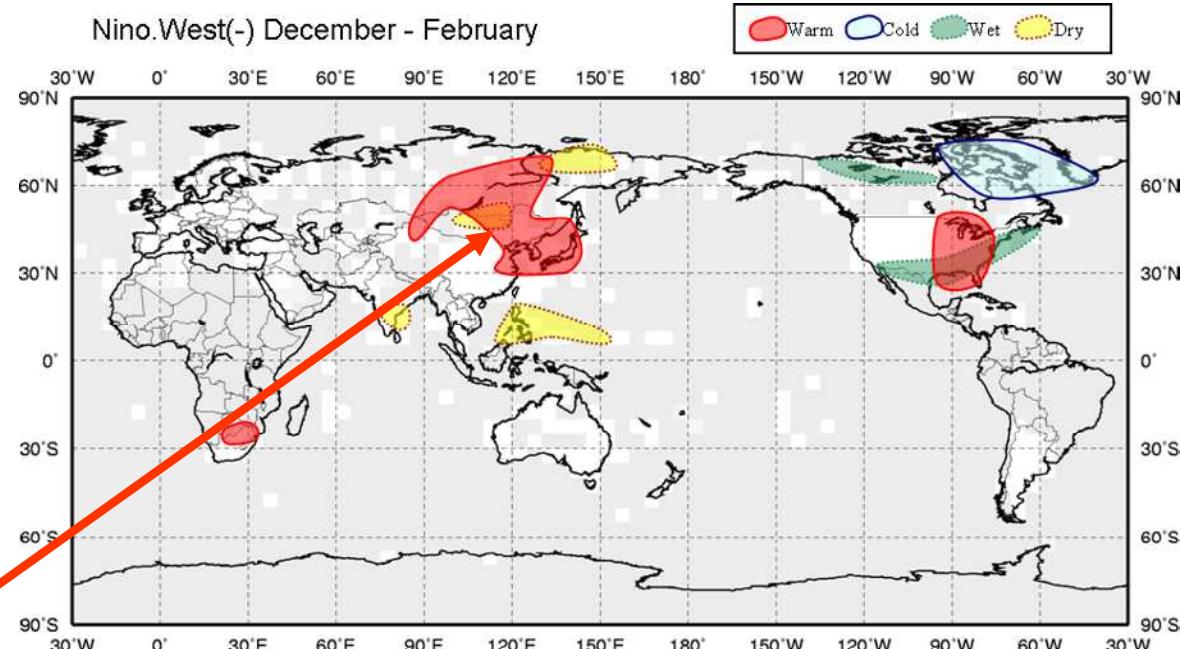

SST deviations for **IOBW** after removed the linear trend in 30years

It is likely that the NINO.WEST SST will be near normal or below normal in the months ahead.

It is likely that the IOBW SST will be near normal in the months ahead.

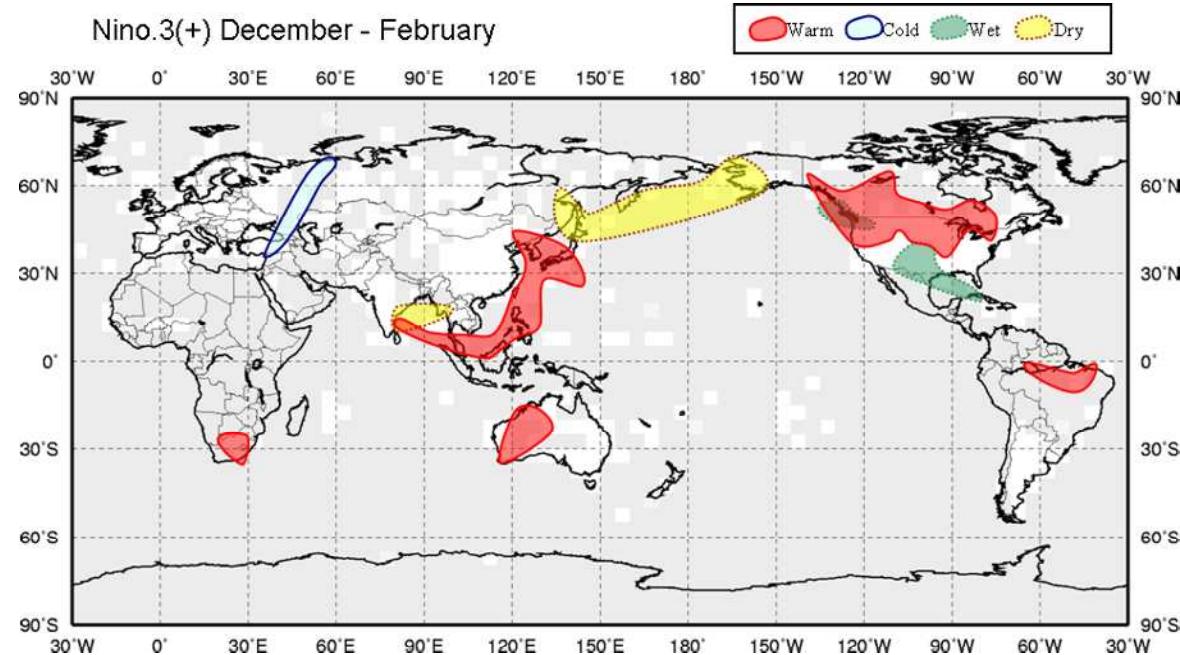

# Impact of NINO.WEST on world climate (DJF)

Impact of below-normal NINO.WEST  
on world climate in boreal winter

Warmer tendency in the East Asia  
is clearer in the NINO.WEST  
impact than in the NINO.3 impact.

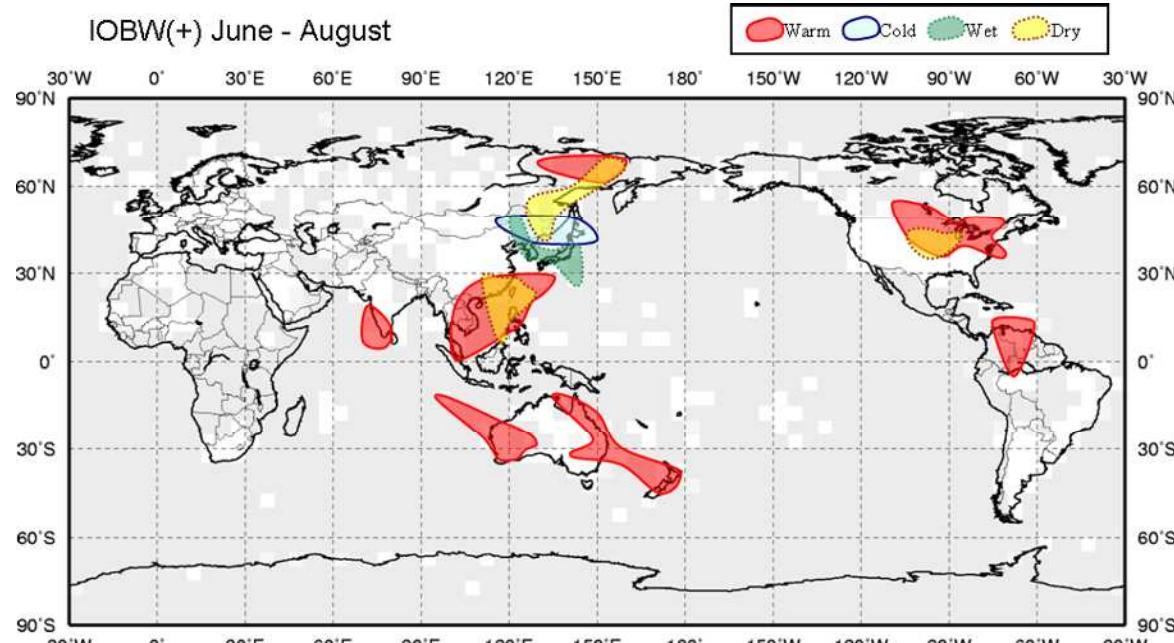

Impact of above-normal NINO.3 on  
world climate in boreal winter

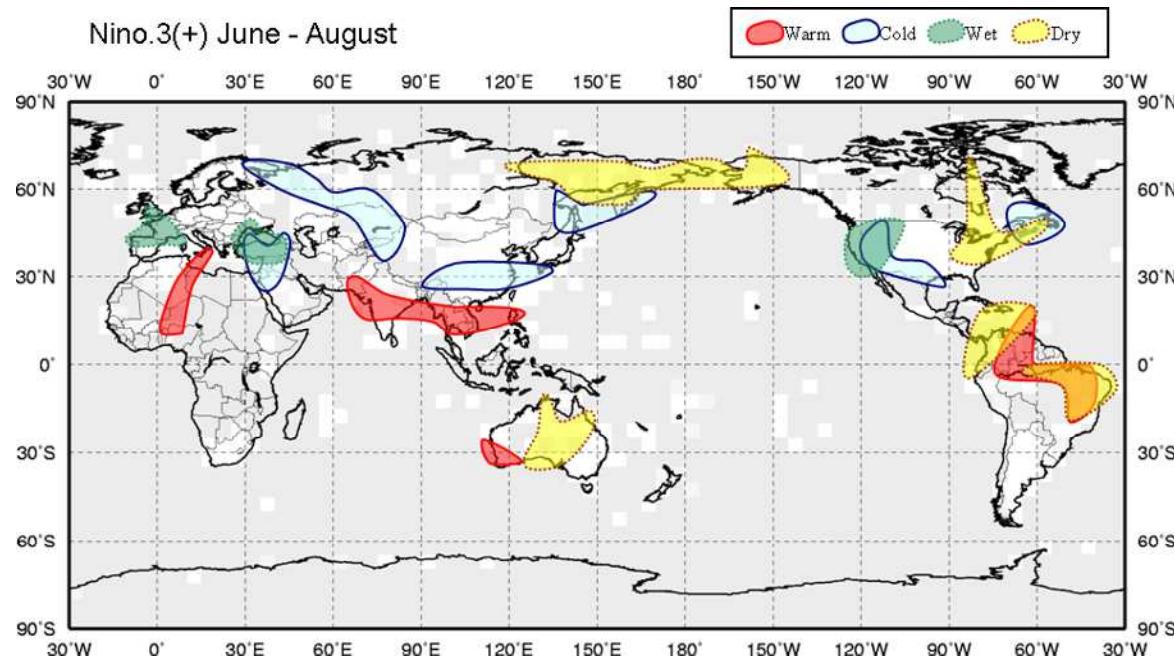

# Impact of IOBW on world climate (JJA)

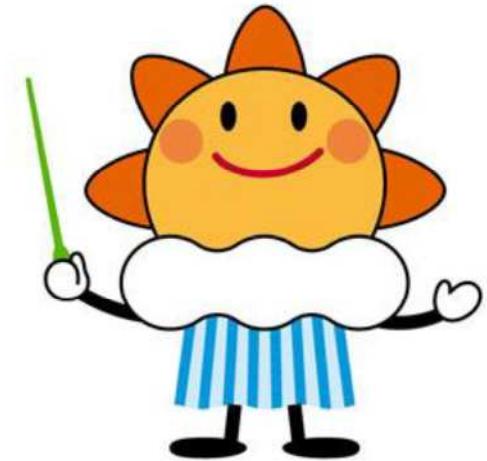

**Impact of above-normal IOBW on world climate in boreal summer**

**When above-normal IOBW SST persists through post-El Niño summer, impacts like the upper panel are expected.**

**Impact of above-normal NINO.3 on world climate in boreal summer**

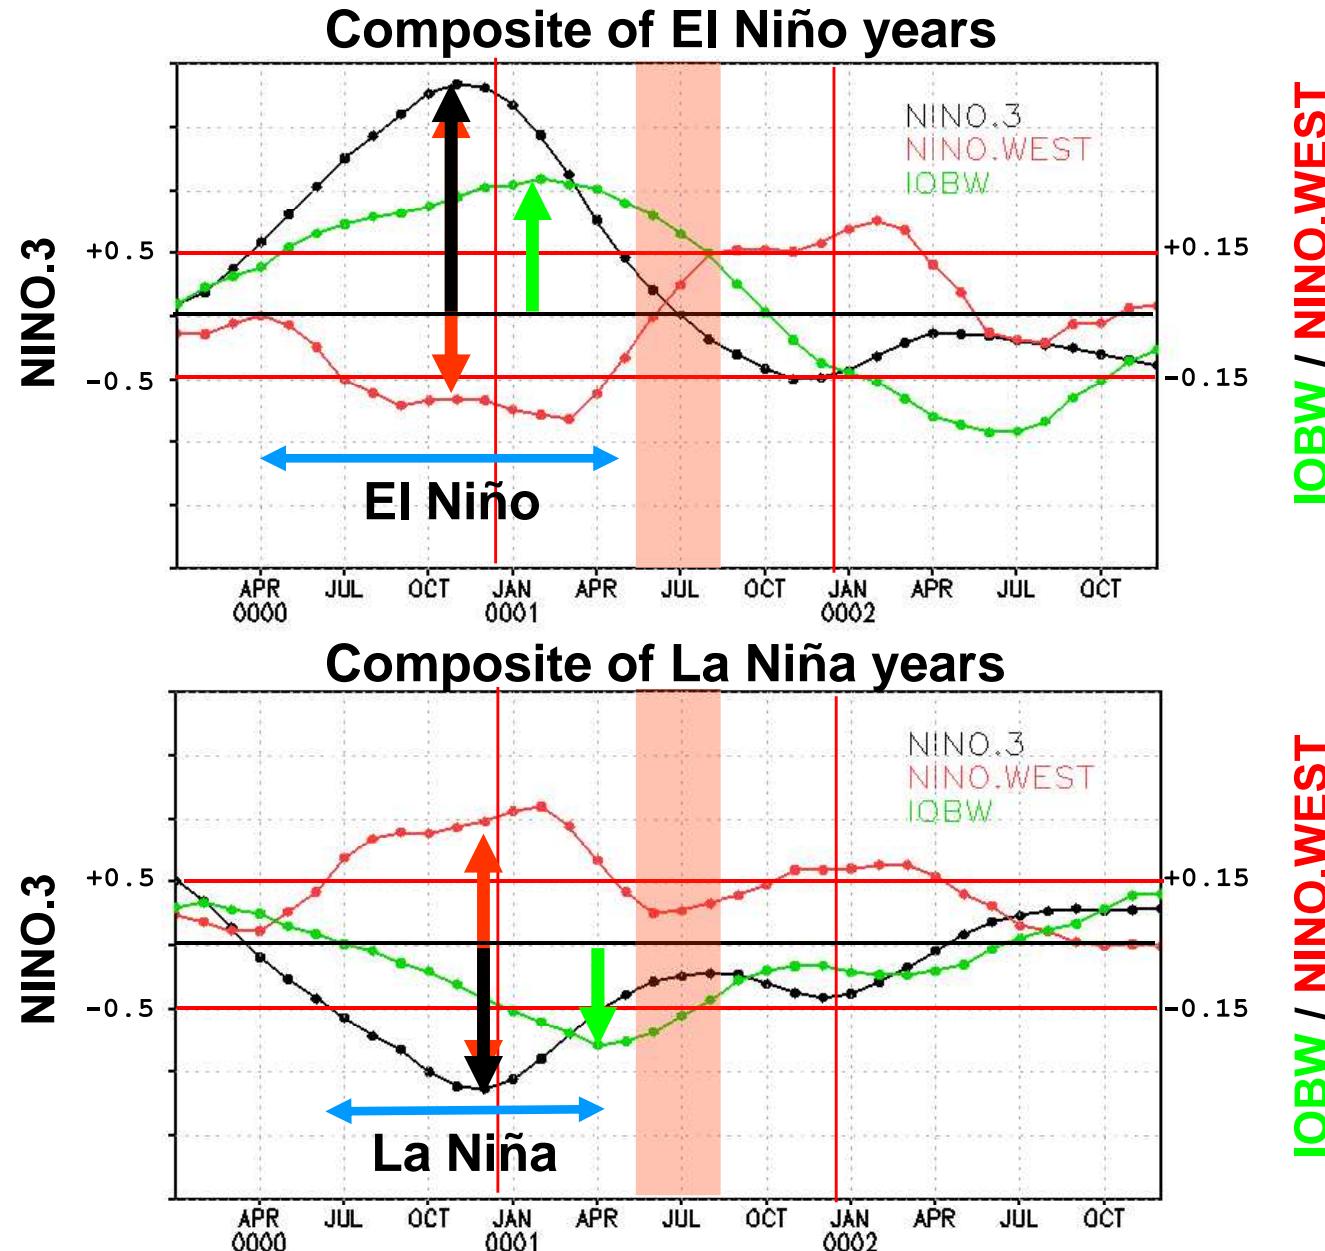

**Thank you for your attention**

# IOBW / NINO.WEST and ENSO

NINO.WEST SST deviation tends to vary with NINO.3, with an opposite sign.

IOBW SST deviation tends to lag about a couple of months behind NINO.3.

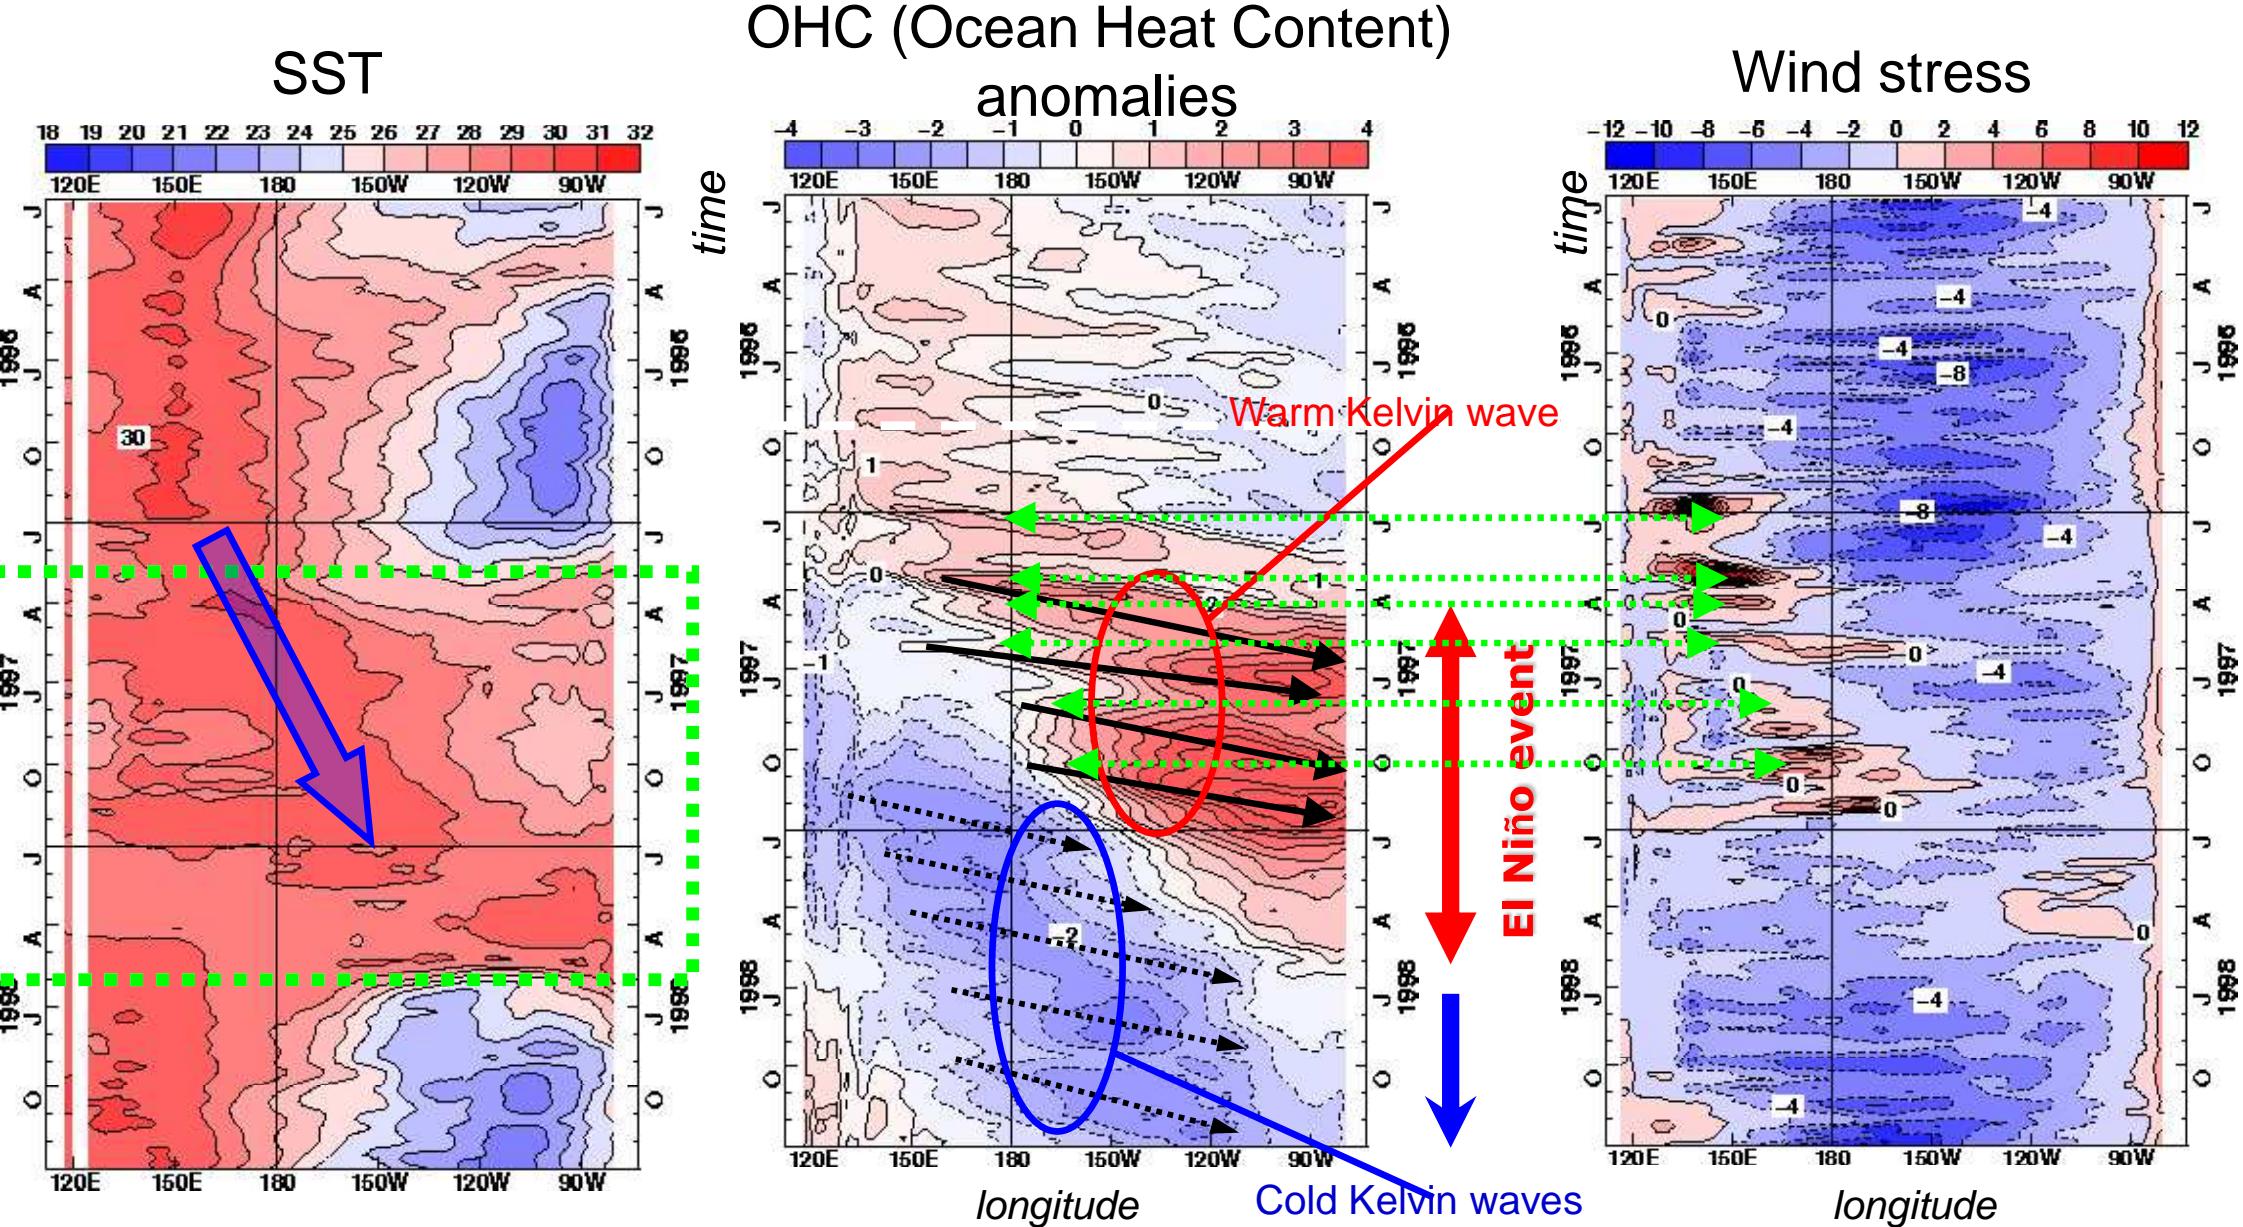

After end of **El Niño (La Niña)** in spring, IOBW tends to stay **above (below)** normal in summer.

# Positive feedback

# Hövmoeller (Longitude-time section) in equatorial Pacific

OHCs are defined as vertically averaged temperatures from sea surface to 300-m depth.
