

# Detection of Kamchatka blocking and its winter circulation pattern

**Baek-Min Kim**

Korea Polar Research Institute

## Cold weather in April, Why?

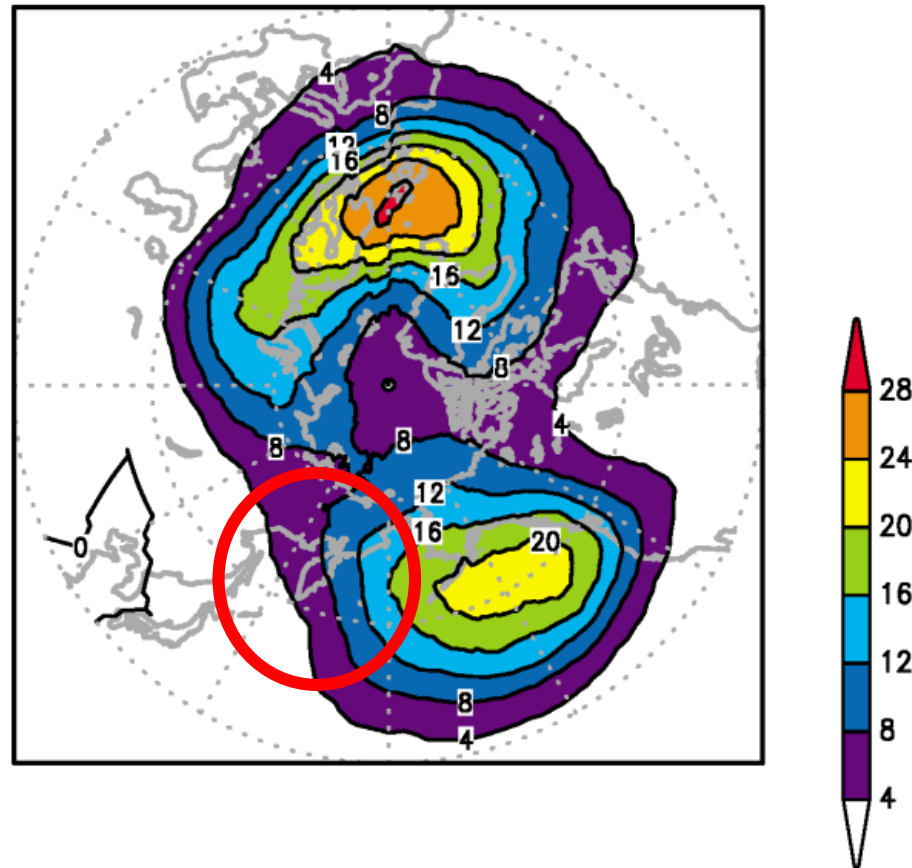

서울 지역 기온 변화 예상 단위:도 최저—0/0—최고 자료:기상청

10일(수)	11(목)	12(금)	13(토)	14(일)	15(월)	16(화)	4월 중순 평년기온
1/9	2/10	2/12	5/18	8/17	4/10	2/10	7.8/18

# But, Kamchatka is not a central location of blocking activity

[JRA55] 1991-2006

Blocking frequency for winter obtained by hybrid blocking detection algorithm based on Dunn-Siguouin et al. (2013)

# Forecaster vs. Meteorologist

Kamchatka Blocking, is it real?

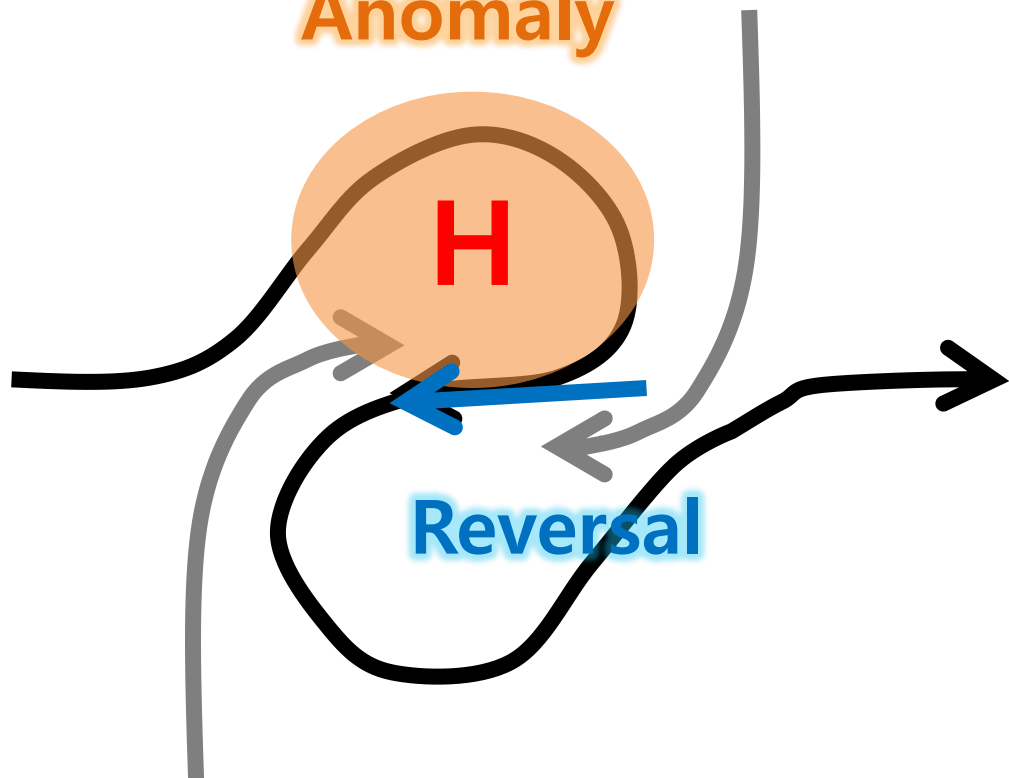

# Definition of Blocking

**Normal**

**Anomaly**

**Block**

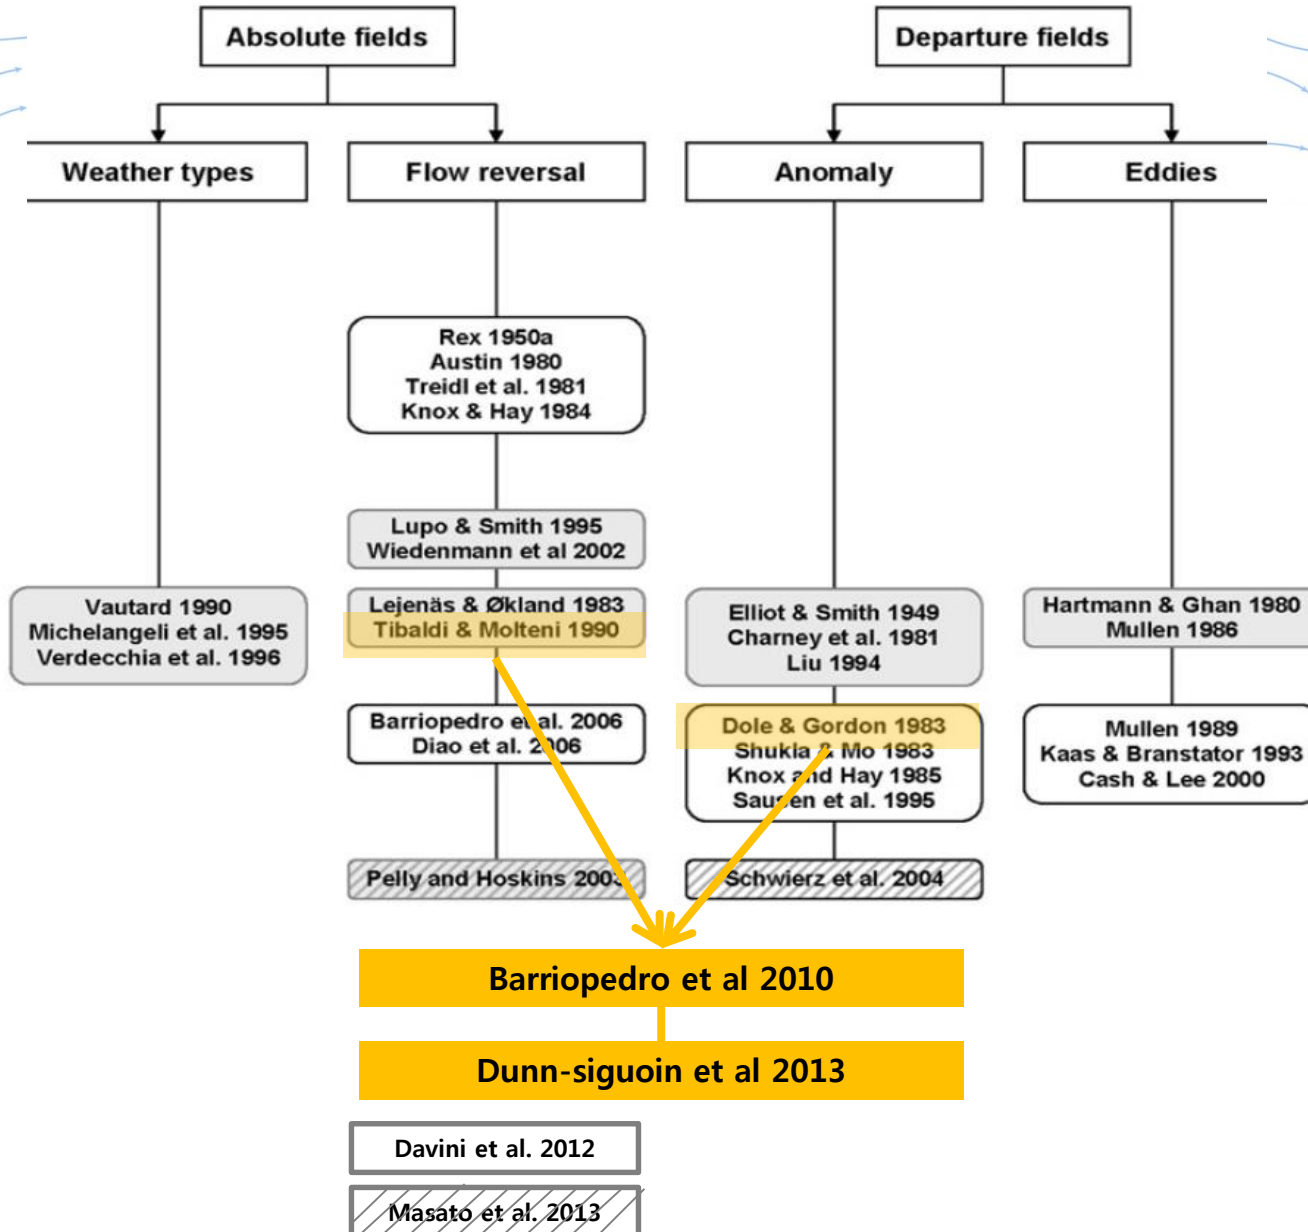

Quasi-stationary high-pressure system that interrupts the eastward propagation of synoptic disturbances by reversing the zonal flow.

# Detection algorithms (History)

Subjective

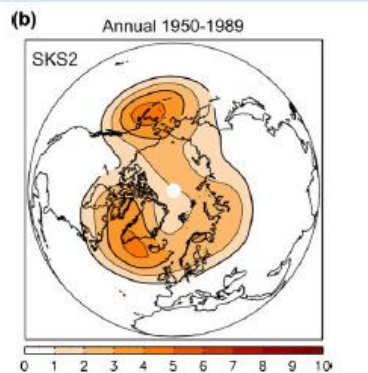

Objective

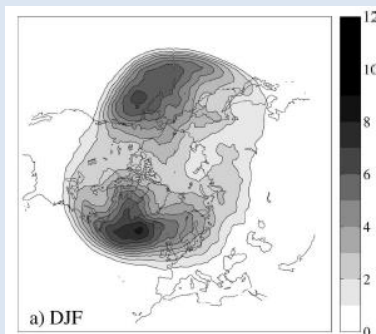

# Different blocking identifications produce different climatology distributions

## Anomaly method

SKS et al 1995  
Z500 anomalies  
NCEP annual  
1950-1989

Croci-Maspoli et al 2007  
Negative PV anomalies  
ERA40 DJF  
1957-2002

## Reversal method

### Local reversal index

Davini et al 2012  
 $dZ500/dy$   
NCEP DJF  
1951-2010

### Large-scale reversal index

Masato et al 2013  
~Pelly & Hoskins 2003  
 $d\theta/dy$  at 2pvu  
ERA40 DJF  
1958-2001  
CI 0.05%

## Hybrid method

Dunn-siguon et al 2013  
SKS+TM  
NCEP DJF  
1960-2010

Barriopedro et al 2010  
TM+SKS  
NCEP annual  
1950-1989

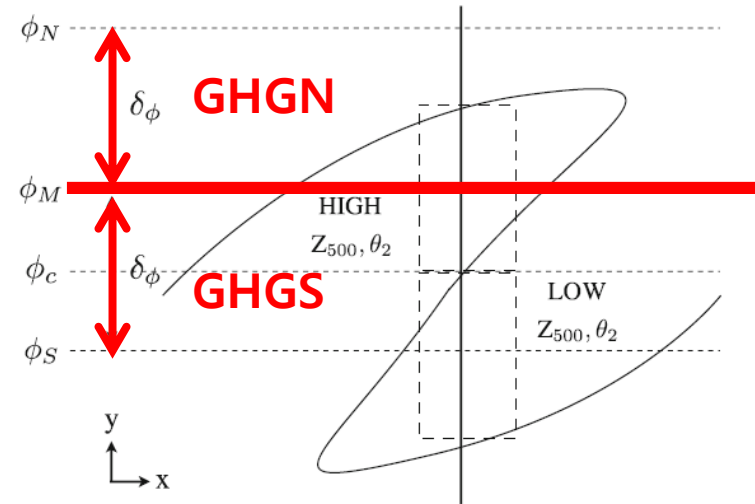

# Reversal method

## 1D Local Reversal Index

Tibaldi & Molteni 1990 ( $Z$ ,  $\phi_M$  fixed at 50N)

$$\text{GHGS} = \frac{\Delta Z(\phi_M, \phi_S)}{(\phi_M - \phi_S)} = \frac{Z(\phi_M) - Z(\phi_S)}{(\phi_M - \phi_S)},$$

$$\text{GHGN} = \frac{\Delta Z(\phi_N, \phi_M)}{(\phi_N - \phi_M)} = \frac{Z(\phi_N) - Z(\phi_M)}{(\phi_N - \phi_M)},$$

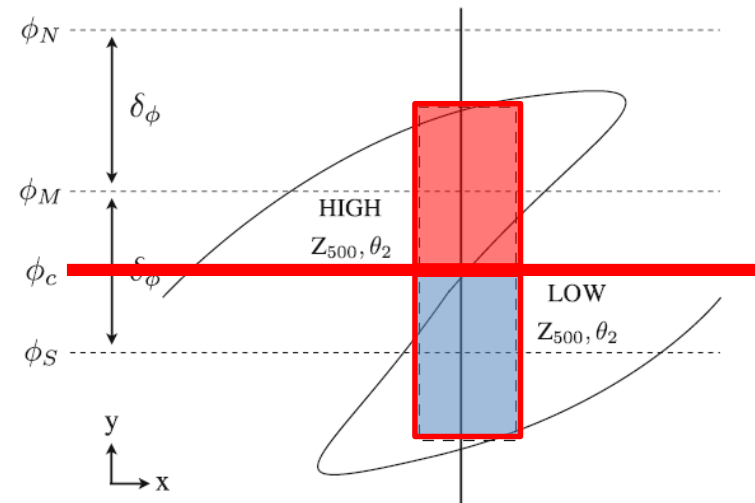

2D  $\approx$  Davini et al 2012 ( $Z$ ,  $\phi_M$  varies 30~75N)

## 1D Large-scale Reversal Index

Pelly & Hoskins 2003 ( $\theta$ ,  $\phi_c$  is max of TEKE)

$$\beta = \frac{1}{\delta\phi} \int_{\phi_c}^{\phi_c + \delta\phi} \theta d\phi - \frac{1}{\delta\phi} \int_{\phi_c - \delta\phi}^{\phi_c} \theta d\phi,$$

2D  $\approx$  Masato et al 2013 ( $\theta$ ,  $\phi_c$  varies 40~70N)

- **Data**

  - NCEP Reanalysis Z500 daily data (DJF, 1950~1989)

- **Blocking Indices**

  - Hybrid index (Dunn-sigouin et al, 2013)
  - Anomaly index (Sausen et al, 1995)
  - Local reversal index (Davini et al, 2012)
  - Large-scale reversal index (Masato et al, 2013)

- **Common thresholds for Blocking detection**

  - O(Overlapping)=50%, S(Min. Area)= $2.5 \times 10^6 \text{ km}^2$ , D(Duration)=5day

# Blocking Frequency Climatology

## Anomaly-based

(a) Hybrid index

(b) Anomaly index

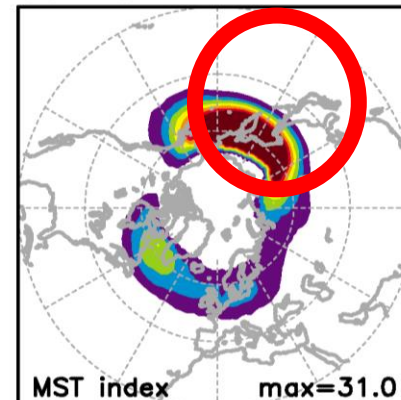

## Reversal-based

(c) Local reversal index

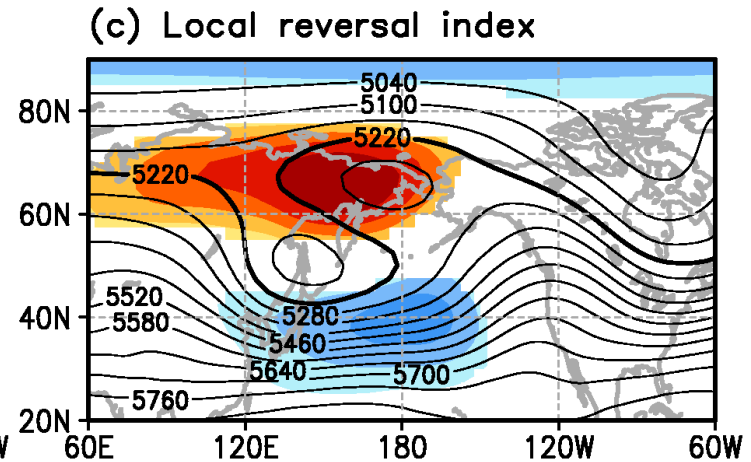

(d) Large-scale reversal index

Event # : (b)410 > (a)274 > (d)206 > (c)185

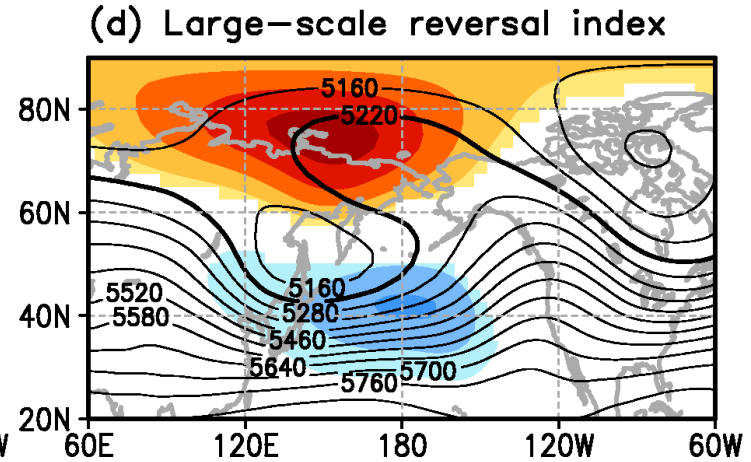

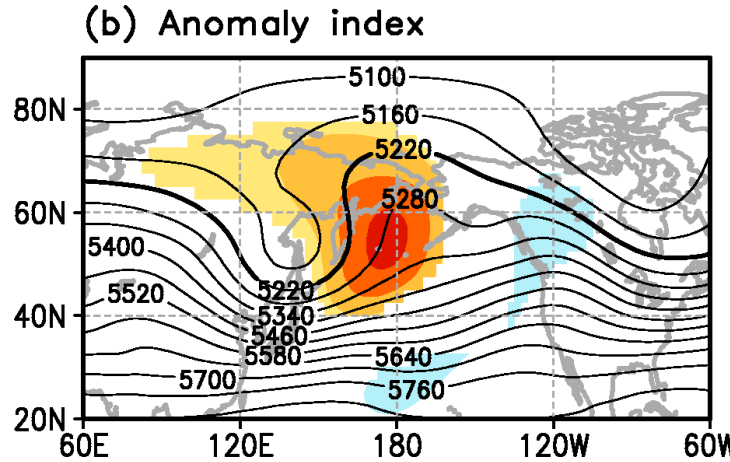

Duration : (d)8.8 > (b)8.4 > (a)8.0 > (c)7.3

# Z500 (contour), Z500 anomaly (shading) composite during Kamchatka blocking [120E-180]

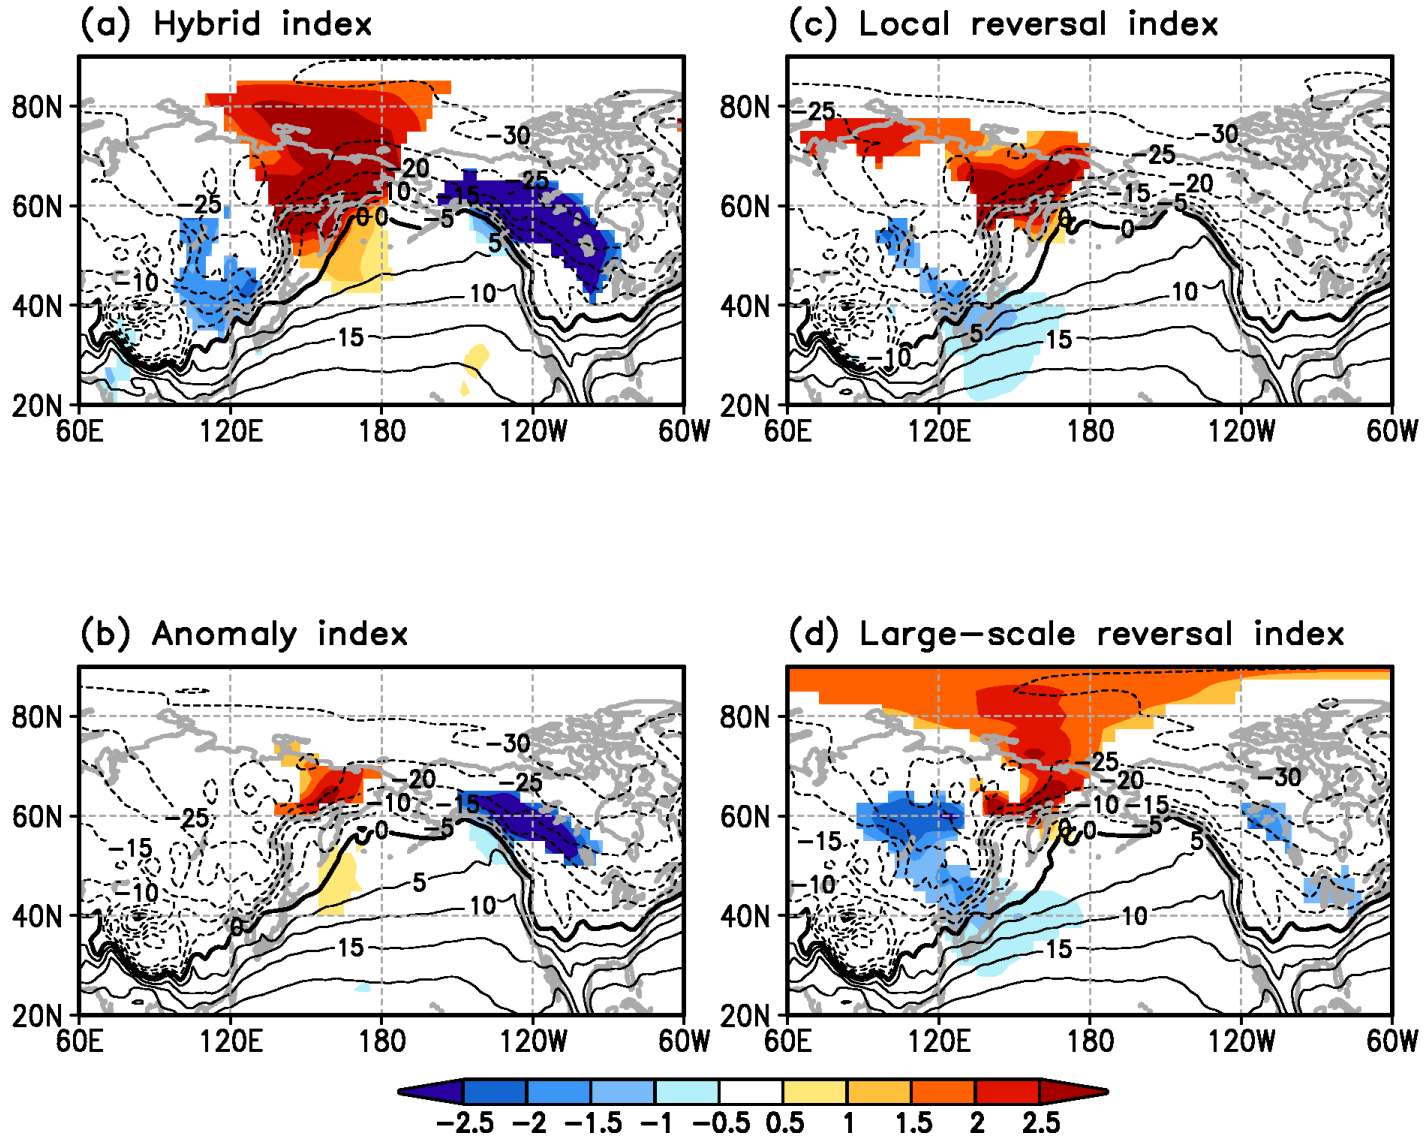

**Dipole blocking pattern with zonal flow reversal**

Event # : (d)123 > (b)107 > (c)88 > (a)65  
 Duration : (d)10.8 > (b)8.1 > (c)7.8 > (a)7.3

# SAT (contour), SAT anomaly (shading) composite during Kamchatka blocking [120E-180]

- Existing Blocking detection algorithms are so diverse and the resultant Blocking frequency maps are also very different with each others.
- Among the diverse detection algorithms, we find that large-scale reversal index only captures Blocking activity over Kamchatka region properly.
- Intrinsic wave breaking activity is well captured by the large-scale reversal index than others and this is the reason.
- Since Kamchatka blocking is related with extreme weathers such as cold surges in winter and heat waves in summer, we need much more efforts especially for understanding the initiation mechanism, its detailed evolution and characteristic changes in association with climate change.

# THANK YOU
